1 INTRODUCTION

1.1 OVERVIEW

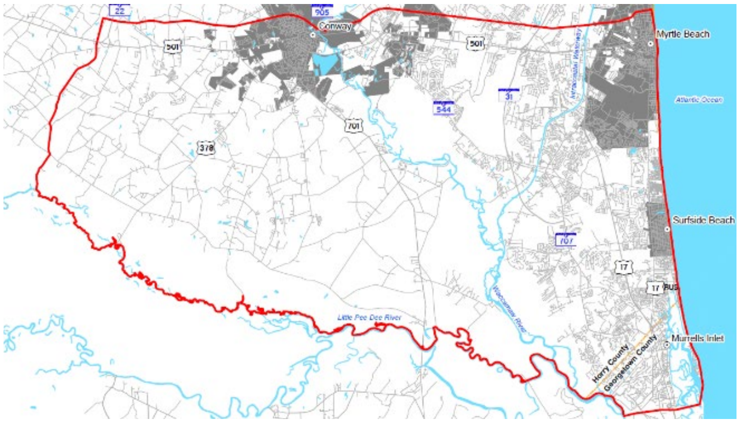

Figure 1: Southern Evacuation Lifeline Study Area

Horry County recognizes the need to have an additional evacuation route leading inland from the coast in the event of a major storm or hurricane. Known as the Southern Evacuation Lifeline (SELL), the project has undergone a number of iterations since its inception in 2003. The road is proposed to be an approximate 28-mile, new location and along existing alignments, highway that would provide a more direct route to the west from the southern portion of the Grand Strand while simultaneously completing a beltway around Myrtle Beach to connect with South Carolina Highway 22 (SC 22). The project study area (PSA) includes a portion of Horry County and a small portion of Georgetown County, see **Figure 1: Southern Evacuation Lifeline Study Area.**

A Draft Environmental Impact Study (DEIS) was completed in 2008 that examined alternatives involving new location roadways, current roadways, or a combination of existing infrastructure and new construction. The DEIS ultimately recommended a new location roadway beginning at US 17 at Surfside Beach, stretching north and ending at US 501 northeast of Conway. The Recommended Alternative included the construction of a bridge over the Waccamaw River as well as five major interchanges at US 17, US 701, US 378, SC 707, and US 501.

Due to development in the area and extended time since the DEIS, the project is being re-evaluated by Horry County, in cooperation with the South Carolina Department of Transportation (SCDOT). Funding is currently identified for limited environmental studies and right-of-way acquisition and funded by Horry County's Road Improvement and Development Effort (RIDE) III program.

The purpose of the Conceptual Alternatives Study is to provide guidance in early planning and evaluation of the proposed SELL routes and future potential funding plans. The guidance is intended for use by Horry County in consultation with SCDOT. The result of the Conceptual Alternative study is a final report that details the project information and requirements that may be necessary to prepare a future application for a permit or development through the state project development process. Resources were assessed at a conceptual level; additional study may be needed. The study process is a streamlined planning and environmental screening process that provides an approximate comparison of alternatives, potential costs, community benefits, and economic development, as well as many different public interest review factors that are affected by each alternative. It also considers various levels of environmental effects of each alternative such as impacts to wetlands, streams, and wildlife. This study will not identify a preferred alternative.

1.2 Background

The SELL project was originally studied and evaluated in the early 2000's with a purpose to meet the needs of improved hurricane evacuation, congestion relief, and improved access to needed services in the South Strand, east and west of the Waccamaw River through the creation of an approximately 28 mile long newly constructed freeway. In August of 2008, a completed and signed DEIS was published which included 28 alternatives which were evaluated with a preferred alternative being chosen at the time. Since the completion of the DEIS new major actions have occurred within the PSA resulting in the necessity to assess new alternatives. For example, new road projects have been constructed or are proposed to be constructed within the PSA. Existing neighborhoods and communities have expanded and new businesses have opened. Due to development in the area, a re-evaluation of the preferred alternative will be necessary.

No federal funds have been designated or identified for the proposed SELL project. As a result of no federal funding, the Federal Highway Administration (FHWA) is no longer the lead agency for the project. If the project is further developed past the Conceptual Alternatives Study, permitting under the Clean Water Act would be required and the U.S. Army Corps of Engineers (USACE) would likely serve as the lead federal agency. Funding for the Conceptual Alternatives Study has been designated and identified within the RIDE III program. The RIDE III program is a tax program created within Horry County to fund a list of road projects within the county that would be funded by a 1% Sales Tax. The sales tax went into effect on May 1, 2017 and will last for 8 years or until April 30, 2025. The eight-year projection revenues from the 1% Sales Tax are estimated to be $592 million. From this estimated revenue, the SELL project has been designated $25 million to be used to further assess and develop the project.

1.3 Existing Facility

According to the U.S. Census Bureau, Horry County was one of the 50 fastest growing counties in the nation between 2010 and 2017. Based on the U.S. Census conducted in 2020, the county population was 351,029. Horry County is projected to have a population of 423,270, including seasonal population, by the year 2040.

The proposed project is located primarily in the western half of Horry County, South Carolina. At 1,134 square miles, Horry County is the largest in South Carolina by land mass and the fourth most populous county in the state with a population of 365,579 in 2021.[1] Land use outside of existing metropolitan areas remain in use for silviculture or small-scale agricultural and is primarily dominated by swamps, wetlands, and streams; however, land to the east of the Waccamaw River is densely developed with subdivisions, golf courses, and commercial parcels.

There are ten primary roadways within the proposed project corridors that may be used or impacted by the proposed project. Descriptions of the existing conditions are below.

[1] https://www.census.gov/quickfacts/fact/table/horrycountysouthcarolina/BZA110220

- US 501 is a northwest-southeast route from I-95 to Myrtle Beach collecting traffic from I-95 and areas north of the I-20 corridor. It is the primary route for tourist traffic through Conway. US 501 at SC 22 exists as a four-lane divided highway with grass median for approximately 5.14 miles before transforming into a five-lane highway with concrete median/two-way left turn lane (TWLTL). Through Conway, US 501 remains a five-lane roadway with TWLTL and additional turn lanes as necessary at major intersections. As US 501 crosses the Waccamaw River, the road narrows and a jersey barrier is present. Once across the Waccamaw River, US 501 widens to include a paved median/TWLTL. Planted medians are present in various locations.

- US 378 is a spur of US 78 that begins in Washington, Georgia and stretches east-west across South Carolina to US 501 in Conway. This route primarily collects traffic from Columbia and the surrounding areas, but is used as an alternate route to Conway when US 501 is over capacity. The road currently exists as a five-lane paved section expanding west out of Conway as a two-lane section with grassed shoulders.

- US 701 extends from Georgetown to eastern North Carolina and intersects US 501 at US 378. The highway through the proposed project area currently exists as a two-lane section through the study area, expanding to a four-lane section south of Conway near Tiger Drive.

- SC 544 begins in Conway at the intersection of French Collins Road and US 501 Business and continues south to its intersection with (US 17 Business/Ocean Lakes Drive. The road connects downtown Conway to South Myrtle Beach/Surfside Beach. Through the project corridor, SC 544 exists as a five-lane roadway with paved median/TWLTL. Dedicated turn lanes are in place at major intersections.

- Holmestown Road connects SC 707 to US 17 south of the City of Myrtle Beach and is a five-lane roadway with paved median/TWLTL. Holmestown Road is primarily used to access residential development on the eastern edge of the Waccamaw River.

- SC 707 is located in Horry and Georgetown counties. It begins at US 17 Business in the Myrtle Beach metropolitan area and ends at an interchange with US 17 south of Garden City Beach. Through the project corridor, SC 707 exists as five-lane roadway with paved median/TWLTL at the beginning of the roadway then changes to a four-lane roadway with paved median/one-way left turn lane at the end of the roadway. Dedicated turn lanes are in place at major intersections.

- SC 22, also known as Conway Bypass and Veteran’s Highway, is a four-lane roadway that connects US 501 north of Conway to US 17 on the north end of Myrtle Beach. Through the project corridor, Conway Bypass exists as four-lane roadway with a grass median.

- Conway Perimeter Road is a proposed roadway to be constructed in the near-term future that would serve as an extension of El Bethel Road, connecting US 378 to US 701. The proposed roadway would be 4 lanes, with a grass or paved median, and turning lanes at the intersections.

- El Bethel Road is a 1.30-mile roadway that begins at US 501 north of Conway and connects to US 378 west of Conway. Through the project corridor, El Bethel Road exists as four-lane roadway with a grass median. The roadway is part of the Conway Perimeter Road Project with the goal of connecting US 378 to US 701.

- US 17 also known as the Coastal Highway is a north-south highway that begins in Virginia and ends in Florida. This 1,206-mile highway runs along the Atlantic coast and serves a large number of metropolitan areas including but not limited to Myrtle Beach and Charleston. Within the PSA, US 17 exists as a four-lane divided highway with a grass median.

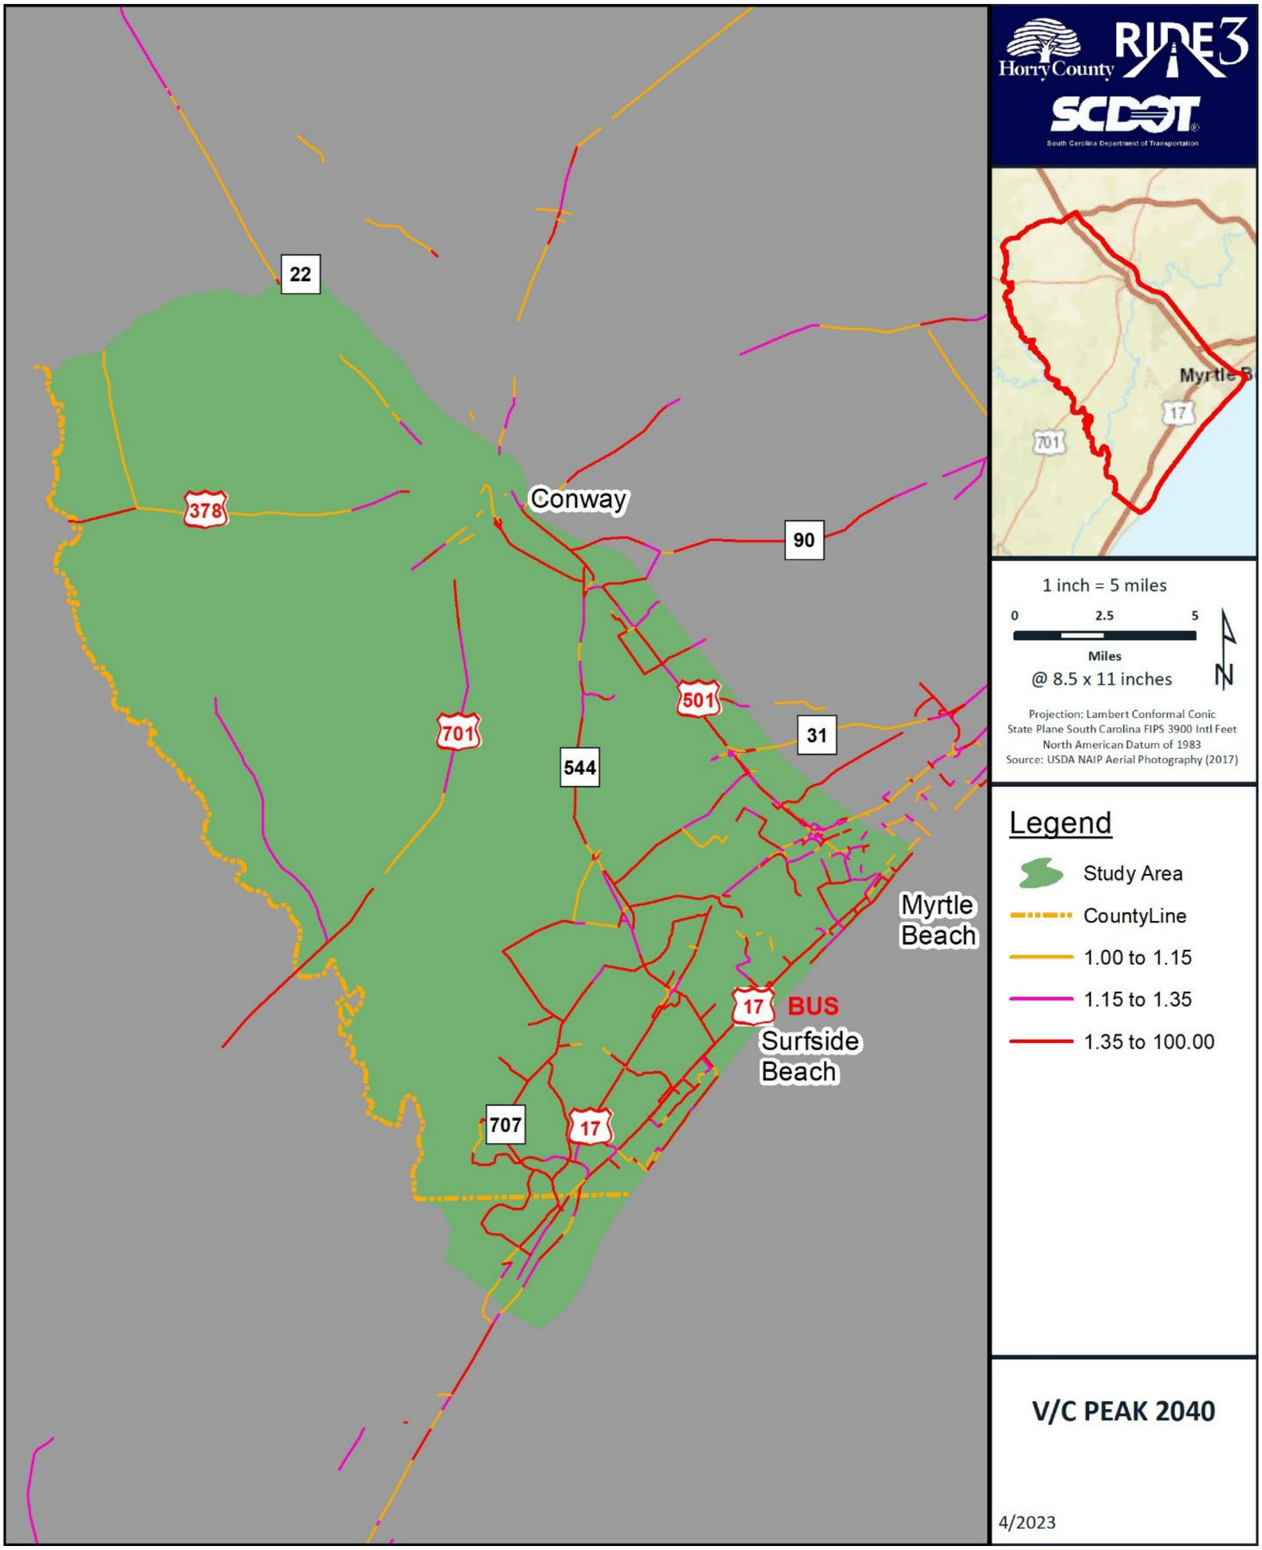
2 PURPOSE AND NEED

The purpose of the project is to provide the region with congestion relief, improved hurricane evacuation, and improved access to needed services east and west of the Waccamaw River.

2.1 CONGESTION RELIEF

A Travel Demand Modeling Technical Report (see Appendix A) was published to provide travel demand modeling and evaluation of the conceptual SELL alternatives. Each alternative was assessed to estimate the amount of potential traffic that would be carried by each alternative. The Grand Strand Area Transportation Study (GSATS) Travel Demand Model has provided projections for the 2040 volume to capacity (V/C) ratios for the peak travel season within the study area. The Transportation Research Board's Highway Capacity Manual defines the capacity of a roadway facility as the maximum hourly rate at which vehicles can reasonably be expected to traverse a point or section of a roadway during a specified time period under typical roadway, traffic, and control conditions. Capacity can also be described as the maximum traffic flow obtainable on a given roadway using all available lanes. V/C represents a comparison of the actual volume of traffic carried by a roadway to the theoretical capacity of the roadway. As the V/C approaches 1.0, or when the remaining available capacity is less than 0.2, the roadway becomes increasingly congested. The 2040 projected levels of congestion of 1.00 V/C or higher are anticipated along major routes within the SELL PSA including US 501, SC 544, US 17, US 701, US 378, SC 707, Holmestown Road, El Bethel Road, Conway Perimeter, and Conway Bypass (SC 22); see Figure 2: V/C Peak 2040.

Figure 2: V/C Peak 2040



Level of Service (LOS) is used to represent the amount of congestion occurring within a network link. LOS is based on the V/C ratio. LOS A indicates the lowest range of V/C and the least congested network links as compared to LOS F indicating the highest range of V/C ratios and the most congested network links. SC 544 and US 501 would have a LOS F in 2040 indicating the most congested network links, see **Appendix B: Traffic Analysis Report**.

2.2 Hurricane Evacuation

A hurricane study was conducted to analyze the evacuation clearance times for Horry County based on the SELL alternatives (see **Appendix C: SELL Hurricane Evacuation Study**). Horry and Georgetown Counties currently have three hurricane evacuation zones of A, B, and C. Evacuation times of these zones are described as "clearance times." Clearance time is the time from the beginning of the evacuation until the last evacuee clears the region. Currently, there are three hurricane evacuation routes within the Grand Strand Area and are located in North Myrtle Beach and the area north of Myrtle Beach, Myrtle Beach, and Garden City Beach south to Winyah Bay in Georgetown. The hurricane evacuation zones evacuate in an order based on the severity of the hurricane. Zone A, located along the coastline, often evacuate for all hurricane severities while B and C evacuations may vary. Depending on where an evacuee lives within a hurricane evacuation zone, they are encouraged to follow the evacuation route provided by Horry County to safely leave the area. These are the only three evacuation routes currently servicing Horry County and its local and visiting populations.[2] For North Myrtle Beach and north of Myrtle Beach, residents and visitors are to use SC 9 to proceed to I-95. Myrtle Beach residents and visitors from 10th Avenue south to Myrtle Beach International Airport are to use 10th Avenue north, to SC 22, to US 501, to US 378 towards Columbia. Garden City Beach residents and visitors are to use US 17, to US 521, to SC 261, to US 378 towards Columbia or US 701, to SC 51, to SC 41, to US 378 towards Columbia. Reversing existing roads results in a substantial commitment of time and resources by Horry County Public Safety.

There is no westbound evacuation route between US 17 through Georgetown and US 501 just east of Conway. An accident or flooding due to rainfall on US 501 between Conway and SC 544 during an evacuation will negatively impact traffic flow. In 2018 flooding from Hurricane Florence nearly closed US 501. Large temporary barriers were constructed to contain high water levels for an extended duration. Businesses that are only accessible from US 501 were impacted, with some relocating for weeks at a time. US 17 over the Waccamaw River in Georgetown was closed to one lane in 2018 due to flooding. Large ferries and barges were staged along the river to prepare for transport across the floodwaters. Due to the long clearance times and the fragility of the evacuation routes due to flooding and traffic concerns, a secondary evacuation route would provide redundancy relief through the evacuation zone.

2.3 Improved Access from East to West over Waccamaw River

Crossing the Waccamaw River and the Atlantic Intracoastal Waterway in the large project study area is limited to two roads, US 501 and US 17, which are approximately 35 miles apart. The restricted ability to cross the Waccamaw River has isolated the South Strand of the Waccamaw Neck areas, as well as areas located west of the

[2] https://www.horrycountysc.gov/departments/emergency-management/hurricanes/evacuations/

river, from the areas east of the river. Inadequate access to services, facilities, and opportunities has a limiting effect on the ability of individuals to improve their well-being in regard to personal economics, health, and safety.

3 LOGICAL TERMINI

A project should have logical termini for transportation improvements as well as an appropriate geographical boundary for evaluating environmental impacts. Logical termini for project development are defined as (1) rational end points for a transportation improvement, and (2) rational end points for a review of the environmental impacts. The environmental impact review frequently covers a broader geographic area than the strict limits of the transportation improvements.

There are four proposed southerly termini for the project; all proposed conceptual alternatives would have the same northeast terminus located at US 501 and SC 22 interchange; see **Figure 3: Terminus Endpoints**.

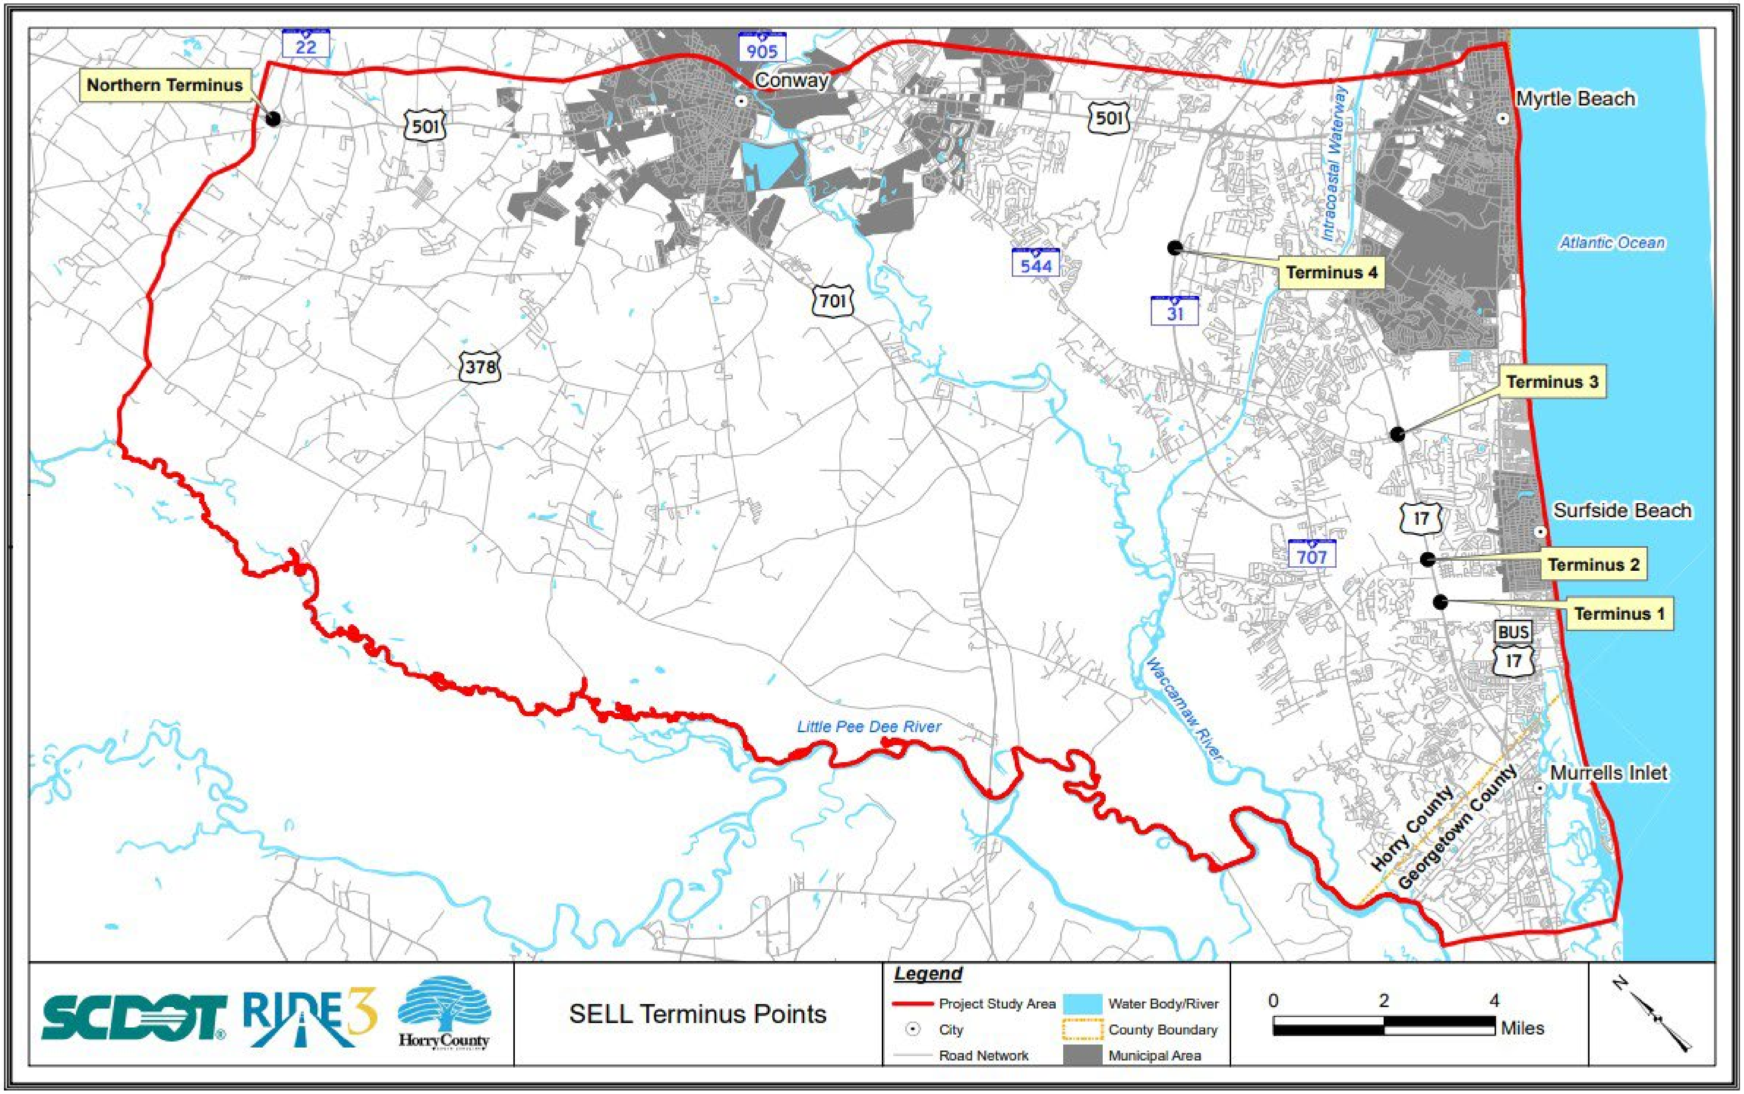
The first proposed terminus, Terminus 1, is located on US 17, approximately 0.80 miles southwest of the US 17 and Holmestown Road intersection, see **Figure 3: Terminus Endpoints**. This southwest terminus was chosen for several reasons, the first being that it creates a new access point onto US 17, south of Holmestown Road. Secondly, this new terminus avoids large-scale relocations of multiple neighborhoods to the south of Holmestown Road.

The next proposed terminus, Terminus 2, is located approximately 0.75 miles north of the first terminus, see **Figure 3: Terminus Endpoints**. This terminus is located on US 17 where Holmestown Road connects to Glenns Bay Road. This terminus avoids large-scale relocations of neighborhoods directly near Holmestown Road.

The next proposed terminus, Terminus 3, is located approximately 2.3 miles north of Terminus 2 at the US 17 and SC 544 interchange, see **Figure 3: Terminus Endpoints**.

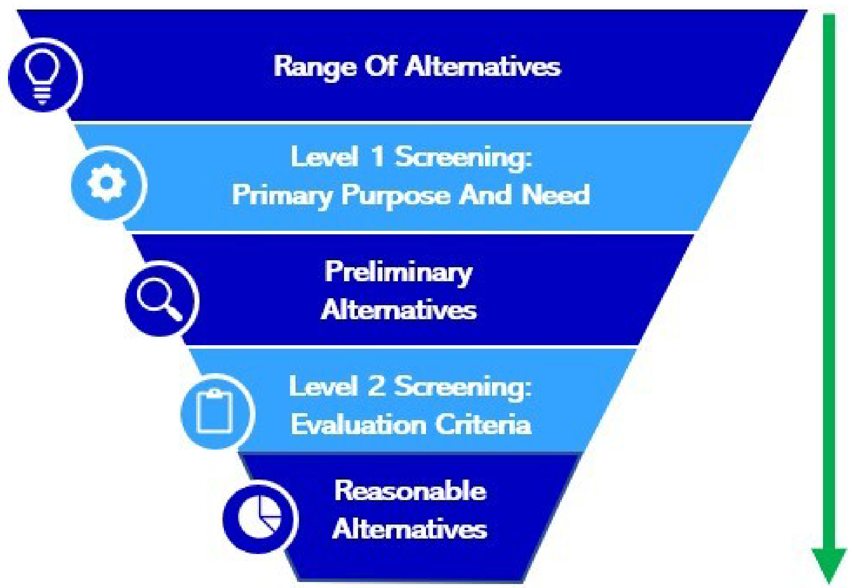
The final terminus, Terminus 4, is located on SC 31, approximately 2 miles south of the US 501 and SC 31 interchange and approximately 2.50 miles north of the SC 544 and SC 31 interchange. This terminus was chosen to create a new access point onto Carolina Bays Parkway in between US 501 and SC 544, as well as provide an exit point for the proposed route over the Waccamaw River to the west of SC 544, see **Figure 3: Terminus Endpoints**.

Figure 3: Terminus Endpoints



4 ALTERNATIVES

For this effort, 17 conceptual alternatives were developed including the No-Build Alternative. In the future, these Conceptual Alternatives will be assessed and updated through the public involvement process. They will be evaluated with screening criteria to determine if they meet the purpose and need. If an alternative does not meet the screening criteria metrics, it will not be further considered as a Reasonable Alternative. Reasonable Alternatives will also be assessed for potential impacts to the natural and human environment. Finally, the Proposed Reasonable Alternative that best balances the potential impacts to the human and natural environment will be recommended as the Preferred Alternative.



There are 16 corridor alternatives that begin at the existing interchange of US 501 and SC 22 northwest of the City of Conway in Horry County, South Carolina. All alternative corridors, except Alternative Corridors 7, 8, and 9, terminate at US 17. Alternative Corridors 7, 8, and 9 terminate at Carolina Bays Parkway (SC 31). The proposed project corridors are being evaluated as a means to provide the region with congestion relief, improved hurricane evacuation, and improved access to needed services east and west of the Waccamaw River as all 16 alternative corridors cross the Waccamaw River.

4.1 No-Build Alternative

For evaluation purposes, the no-build alternative was generally defined as the existing stretch of roadway from the US 501 and SC 22 interchange to SC 544; and from the SC 544 and US 501 interchange to US 17.

4.2 Conceptual Build Alternatives

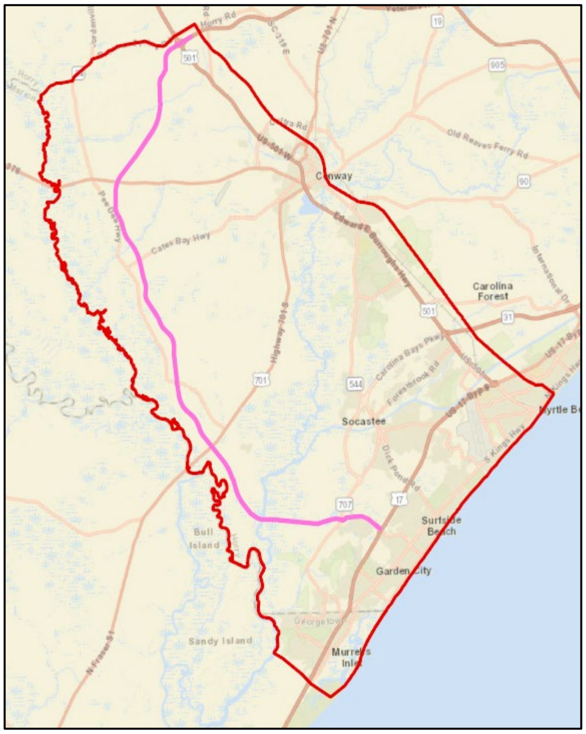
Sixteen corridor alternatives were developed to meet the project purpose and need. Alternatives 1 through 13 are all new alignments. Alternatives 14 and 15 are combinations of the new alignments and existing routes. Alternative 16 is entirely on existing routes. For the alternatives that incorporate the existing routes, the existing arterials alignments were analyzed with widening by two additional lanes. All new alignments were analyzed as four-lane expressways to accommodate the traffic projections and address high levels of congestion.

4.3 Proposed Alternatives Conditions

The proposed new location roadway alternatives would consist of three distinct typical sections through the corridor: a four-lane divided highway with two lanes in each direction, a four-lane highway with two lanes in each direction divided by a median, and a four-lane bridge section with two lanes in each direction. The existing US 501/SC 22 interchange would be extended to the west to accommodate the new location alternatives 1 through 13 (see **Appendix D: Alternatives**). Interchanges will be constructed as US 378, US 701, US 501, SC 544, SC 31, SC 707, and US 17 where proposed new location segments cross or intersect these routes. For alternatives that include widening of existing routes, SC 544 and US 501 would be widened from 5-lanes to 7-lanes with two-way left turn lanes. For alternatives 14 through 16, the existing interchange at SC 544/US 501 will be modified.

The study area largely consists of agricultural and silvicultural fields with residential development along existing roadways. The corridor would generally follow open land to avoid impacts to residential properties. The alternatives considered were each developed to meet the purpose and need of the project while having minimal impacts on the natural and human environment. Each alternative would result in impacts to residential and commercial structures, streams and wetlands, and existing traffic patterns. The southeastern section of the study area is heavily developed with dense residential and commercial development from the eastern boundary of the Waccamaw National Wildlife Refuge to US 17. The following sections examine the proposed alternative routes and their impacts.

4.3.1 Alternative 1



Alternative 1 (**Appendix D, Alternative 1 Corridors Map**) would consist of a 28.48-mile new location roadway beginning at US 501/SC 22 interchange traveling south/southwest toward Busy Corner Road before crossing Busy Corner Road and turning south/southeast. The proposed roadway would then continue, generally parallel to the Pee Dee Highway, to US 701. Alternative 1 would then continue towards the south of the Bucksport area where it would turn east, travel across the Waccamaw River/Wildlife Refuge, and continue approximately 2.5 miles before turning northeast to cross SC 707. The proposed roadway would then join and follow Holmestown Road to its intersection with US 17.

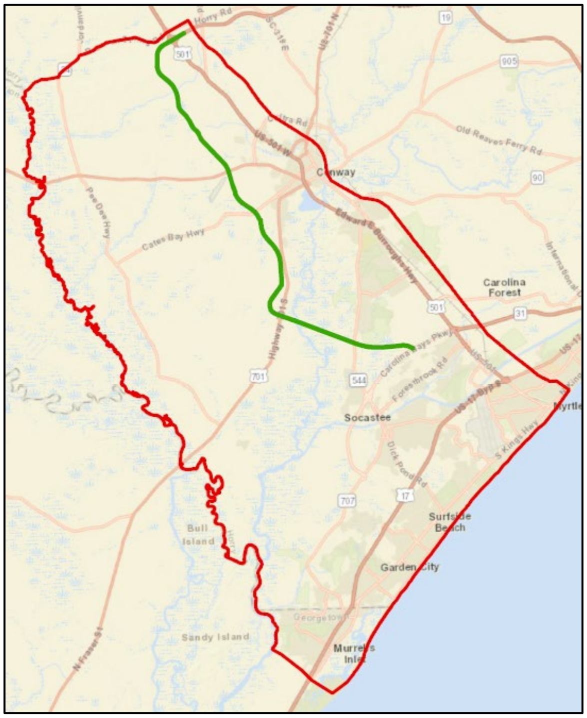
4.3.8 Alternative 8



SEE **APPENDIX D** FOR FULL-SCALE FIGURE

Alternative 8 (**Appendix D, Alternative 8 Corridors Map**) would consist of a 19.69-mile new location roadway beginning at US 501/SC 22 interchange traveling southwest toward Busy Corner Road before turning southeast. The proposed roadway would cross US 378 and Cates Bay Highway and curve southward approximately 0.50 mile south of Pitch Landing Road. Just west of US 701, the road would turn south and run parallel along US 701 before curving east to cross US 701 near Toddville and the Waccamaw River/Wildlife Refuge to SC 544 to its terminus at SC 31 approximately 2.30 miles southwest of US 501.

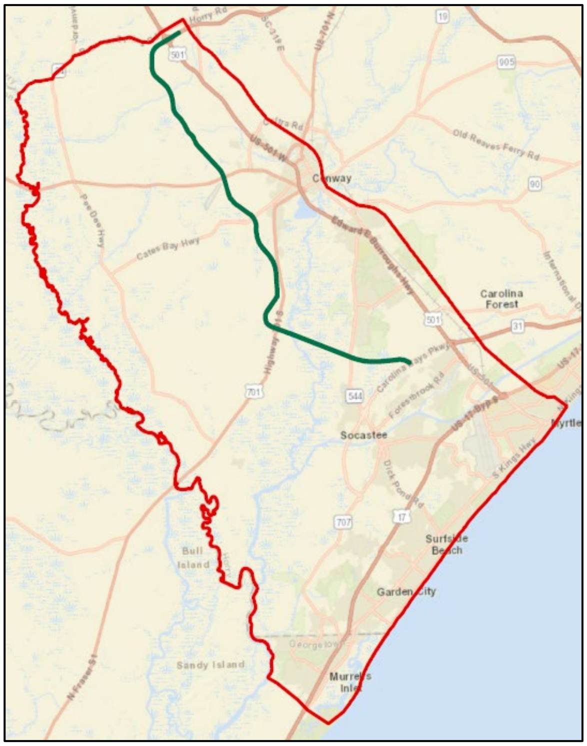
4.3.9 Alternative 9



SEE **APPENDIX D** FOR FULL-SCALE FIGURE

Alternative 9 (**Appendix D, Alternative 9 Corridors Map**) would consist of a 19.73-mile new location roadway beginning at US 501/SC 22 interchange traveling southwest toward Busy Corner Road before turning southeast. The proposed roadway would cross US 378 then cross Dirty Branch Road approximately 0.80-mile south of its intersection with US 378. The road would then turn southeast through the Woodland Lakes subdivision before turning south to cross Dirty Branch Road again and then cross Cates Bay Highway. The roadway would then curve southward approximately 0.50 mile south of Pitch Landing Road. Just west of US 701, the road would turn south and run parallel along US 701 before curving east to cross US 701 near Toddville and the Waccamaw River/Wildlife Refuge to SC 544 to its terminus at SC 31 approximately 2.30 miles southwest of US 501.

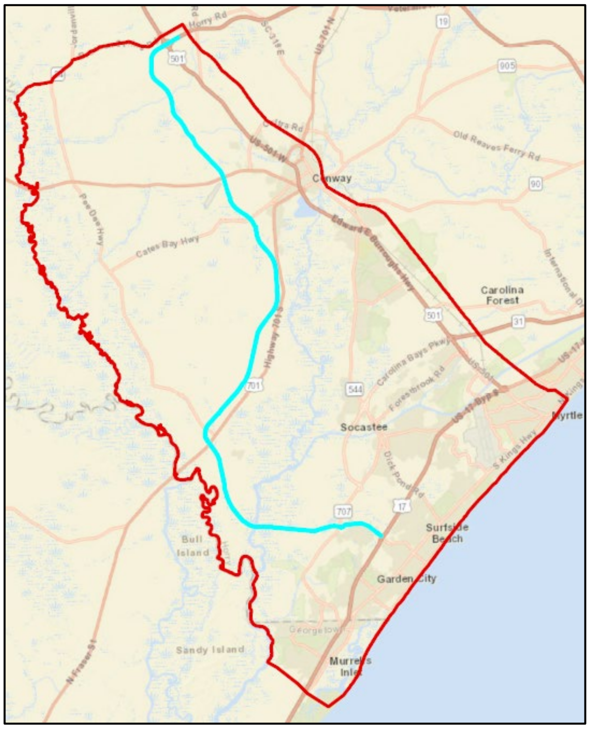
4.3.10 Alternative 10



Alternative 10 (**Appendix D, Alternative 10 Corridors Map**) would consist of a 29.20-mile new location roadway beginning at US 501/SC 22 interchange traveling southwest toward Busy Corner Road before turning southeast. The proposed roadway would cross US 378 and Cates Bay Highway and curve southward approximately 0.50 mile south of Pitch Landing Road. Just west of US 701, the road would turn south and run adjacent to US 701 to the Pee Dee Highway where it would curve southeast, cross US 701 and continue southeast to Bucksport. As the new roadway crosses Treatment Road, it would begin to turn east to cross the Waccamaw River/Wildlife Refuge and continue approximately 2.5 miles before turning northeast to cross SC 707 before joining and following Holmestown Road to its intersection with US 17.

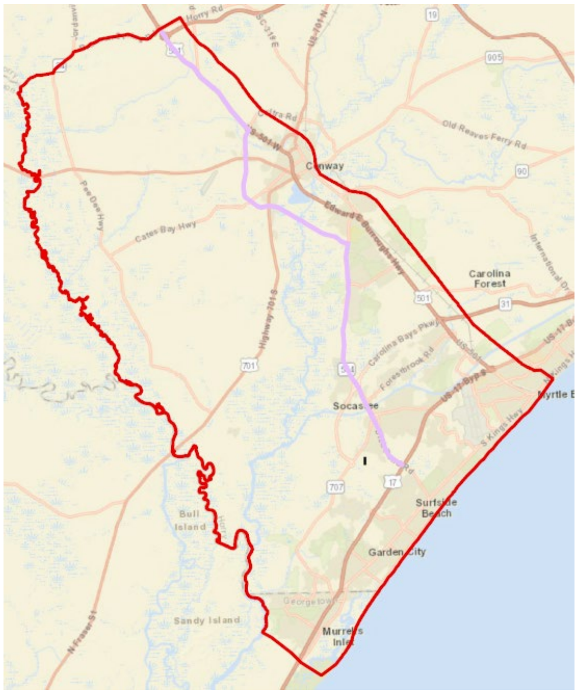
4.3.14 Alternative 14



SEE **APPENDIX D** FOR FULL-SCALE FIGURE

Alternative 14 (**Appendix D, Alternative 14 Corridors Map**) would consist of a 22.21-mile roadway that would utilize both existing and new location roads beginning at US 501/SC 22 interchange. The proposed corridor would follow US 501 southeast toward Conway, turn south at El Bethel Road and follow El Bethel Road and the proposed Conway Perimeter Road to US 701. The corridor would then continue southeast through the Pecan Grove subdivision and cross the Waccamaw River/Wildlife Refuge. The proposed road would then turn south to follow SC 544 to its intersection with US 17.

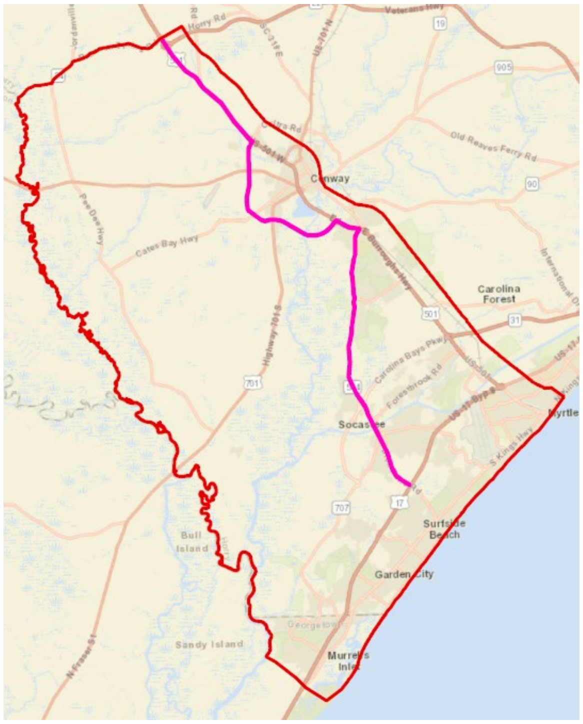
4.3.15 Alternative 15



SEE **APPENDIX D** FOR FULL-SCALE FIGURE

Alternative 15 (**Appendix D, Alternative 15 Corridors Map**) would consist of a 23.77-mile new location roadway that would utilize both existing and new location roads beginning at US 501/SC 22 interchange. The proposed corridor would follow US 501 southeast toward Conway, turn south at El Bethel Road and follow El Bethel Road and the proposed Conway Perimeter Road to US 701. The corridor would then continue southeast through the Pecan Grove subdivision and cross the Waccamaw River/Wildlife Refuge. Immediately after crossing the Waccamaw River/Wildlife Refuge, the corridor would then turn north to meet US 501 at Academy Drive. The road would follow US 501, turn south at SC 544, and follow SC 544 to its intersection with US 17.

Fourmile Swamp	Waccamaw River	

5 ALTERNATIVES: MEASURES OF EFFECTIVENESS AND IMPACTS

The No-Build alternative is considered a comparison for evaluating the benefits and impacts of the other reasonable alternatives. The No-Build alternative means continued use of the existing roadways present within the study area with no roadway improvements implemented. The primary existing roadways within the PSA are US 501, US 17, US 378, US 701, SC 544, SC 707, SC 22, Conway Perimeter Road, Holmestown Road, and El Bethel Road. The travel demand modeling analysis effort was to incorporate conceptual SELL alternatives into the travel demand model and use the model outputs to assess the estimated amount of traffic that would be carried by each alternative and the efficiency in which they carry the traffic loads. The data collected was then used to determine if the proposed alternatives meet the purpose and need of the SELL project. Based on the technical report the No-Build option does not meet the purpose and need by not relieving the traffic congestion or decreasing hurricane evacuation clearance times. Not only does it not meet the main needs of the project, but it will not be able to functionally serve the growing traffic that is expected by 2050.

Based on the measures of effectiveness (MOE) referenced in the technical report, the primary MOE that were considered at the conceptual level were vehicle hours traveled (VHT), and travel time (in minutes) from the northern terminus of the project at the existing interchange of 501 and the Conway Bypass (SC 22) to the far end of the project at the southern terminus in an area generally bounded by the Georgetown County line, US 17, SC 544, and US 501.

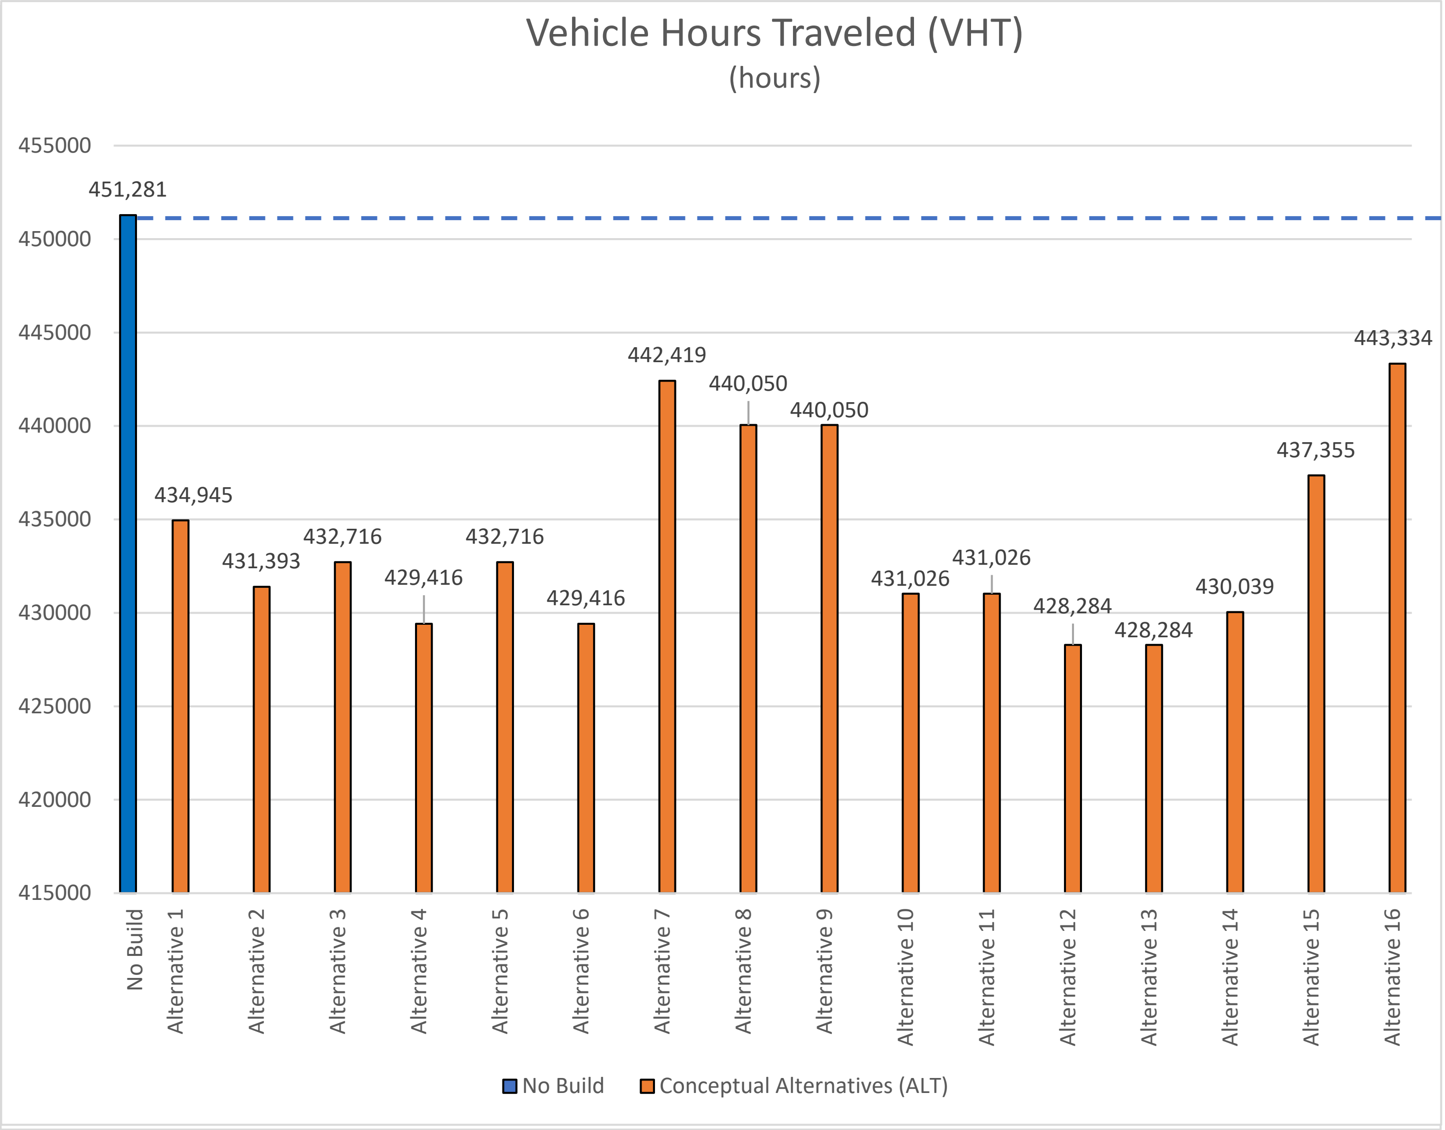
5.1 VEHICLE HOURS TRAVELED

VHT represents the time, in hours, of every car in the system travelling within a day. The data for VHT is based on average daily trips during each time period and has been calculated for each alternative route. The lowest VHT is considered to be the most optimal alternative route within the study area due to the route relieving congestion as well as creating access to new routes for travelers to reach their destinations faster.

VHT for the No-Build option or existing route would be 451,281 hours and would have the highest VHT when compared to the proposed SELL routes (Figure 4: Vehicle Hours Traveled). All other proposed SELL routes would decrease VHT by at least 10,000 hours. Alternatives 12 and 13 would have the lowest VHT at 428,284 hours. Alternatives 14-16 that utilize the existing roadways with additional widenings would have the highest estimated travel times out of the other proposed SELL routes (between 430,039 and 443,334 hours.) Alternative 16 would have the highest VHT out of the proposed SELL routes at 443,334 hours.[3]

[3] Travel Demand Modeling Technical Report. May 2022.

Figure 4: Vehicle Hours Traveled



5.2 TRAVEL TIME

The average travel times for the SELL alternatives between two locations near US 17 Bypass near the termini of the new alignment routes and at the US 501/SC 22 interchange were prepared from the individual alternative model runs. **Figure 5: Travel Time Terminus Start and End Points** illustrates the locations of the two starting points and the termination point. The locations are:

• SC 544 south of the US 17 Bypass (at the intersection of SC 544 and Beaver Run Road - shown with a green star)

• Holmestown Road south of US 17 Bypass (at the intersection of Holmestown Road and Hopkins Circle - shown with a blue star)

• US 501 north of the US 501/SC 22 interchange (at the intersection of US 501 and Bunson Spring Road/Horry Road – shown with a red star).

Figure 5: Travel Time Terminus Start and End Points

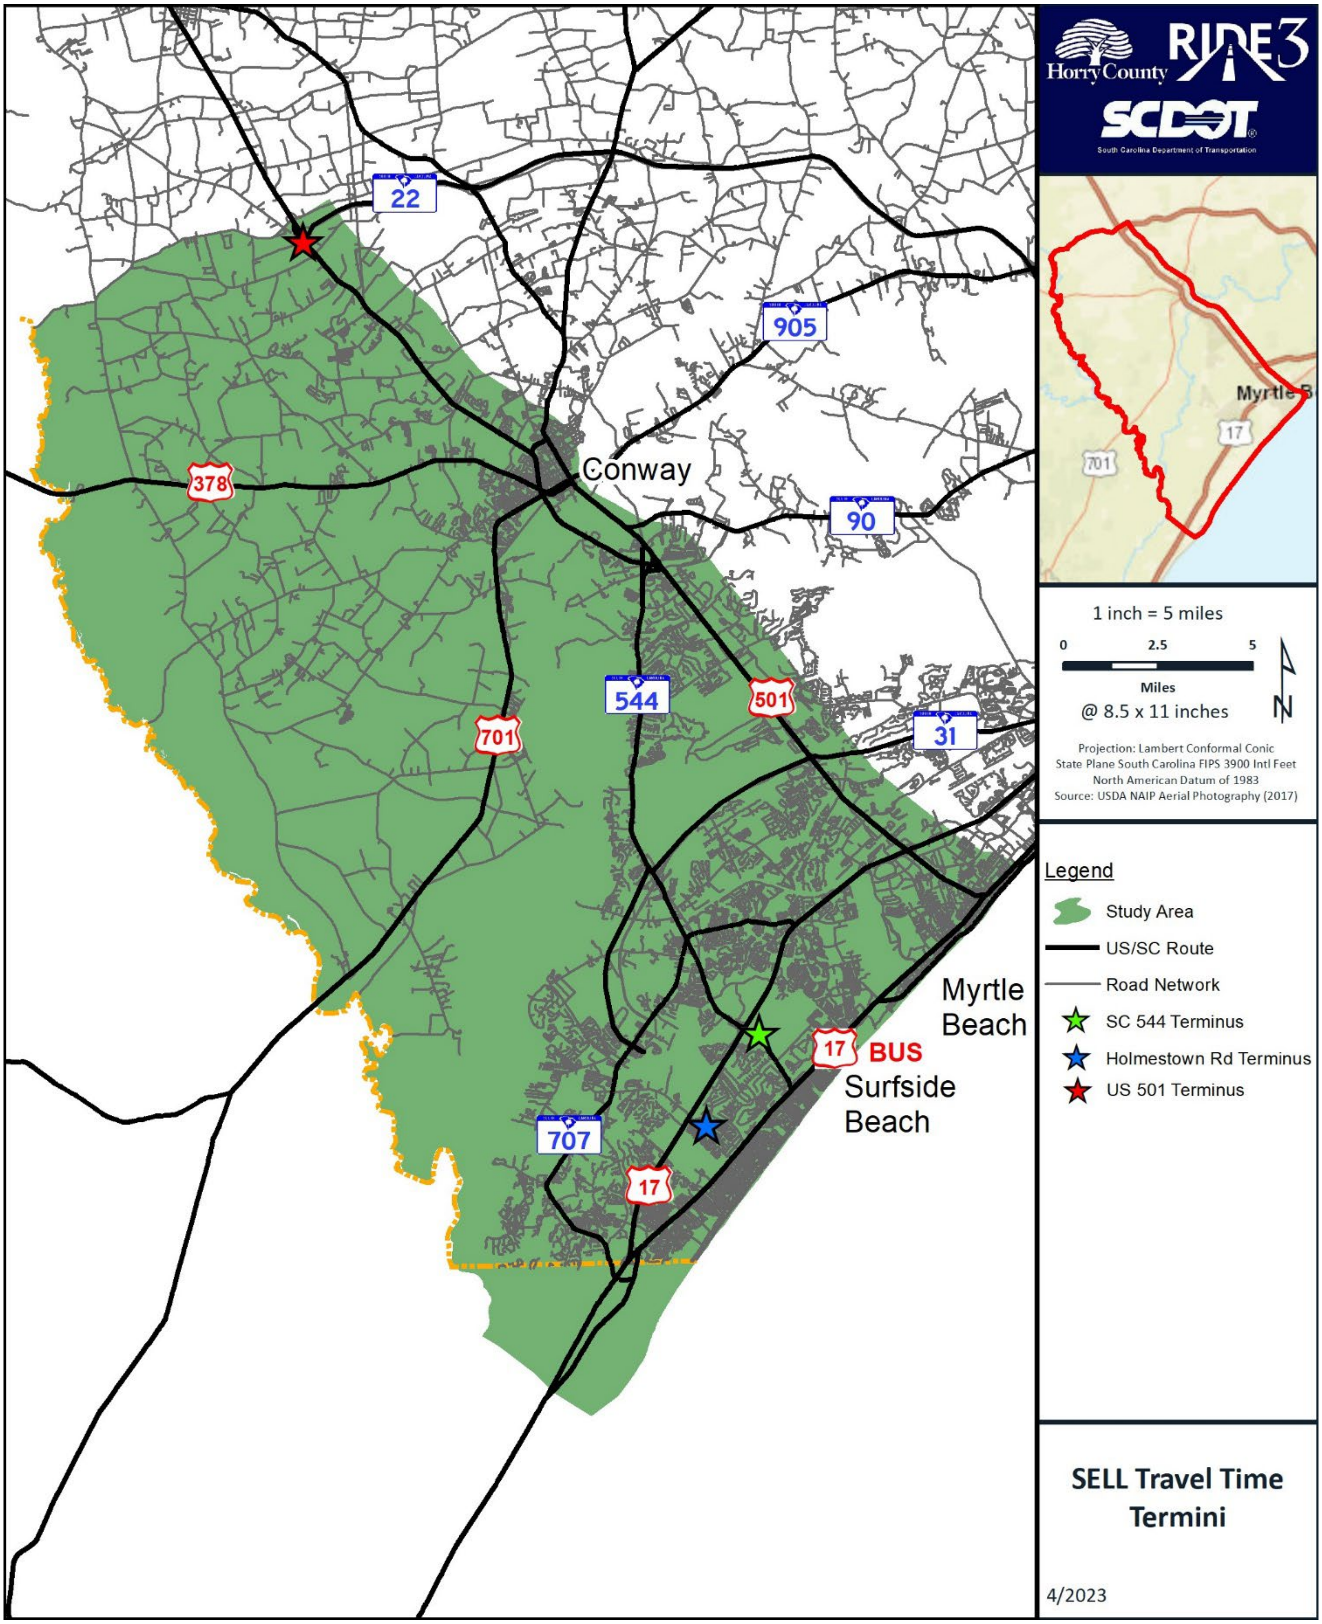


Table 1: Average Travel Time Between US 17 Bypass and US 501/SC 22 Interchange summarizes the 2040 AM and PM peak hour congested travel times between the termini for each alternative, including the no-build alternative, as estimated by the model.

Table 1: Average Travel Time (minutes) Between US 17 Bypass and US 501/SC 22 Interchange

Alternative	SC 544 south of US 17 Bypass (at Beaver Run Road)		Holmestown Road south of US 17 Bypass (at Hopkins Circle)	
	AM	PM	AM	PM
No Build	**44.2**	**115.3**	**51.2**	**129.1**
1	36.6	65.5	29.5	40.0
2	37.1	67.7	30.3	42.4
3	36.1	64.7	29.2	39.3
4	36.6	67.1	29.9	41.9
5	36.1	64.7	29.2	39.3
6	36.6	67.1	29.9	41.9
7	30.6	57.0	37.4	84.6
8	29.9	56.4	36.8	84.0
9	29.9	56.4	36.8	84.0
10	37.0	65.0	30.2	39.7
11	37.0	65.0	30.2	39.7
12	37.4	67.4	30.8	42.4
13	37.4	67.4	30.8	42.4
14	28.9	66.6	36.3	98.0
15	32.4	78.5	39.9	109.6
16	33.7	88.4	41.2	119.0

Figure 6: AM Travel Times from US 17 Bypass to US 501/SC 22 shows the average AM travel time from US 17 Bypass to US 501/SC 22 using either SC 544 south of US 17 Bypass or Holmestown Road south of 17 Bypass. The No Build has the highest AM travel time for both routes than any of the alternatives. New location alternatives 1-6 and 9-13 have a lower travel time from US 17 Bypass to US 501/SC 22 compared to the widening of existing location alternatives 15 and 16. Overall, all 16 alternatives would save at least 7.6 minutes utilizing SC 544 to travel from US 17 Bypass to US 501/SC 22 and 10 minutes utilizing Holmestown Road to travel from US 17 Bypass to US 501/SC 22.

Figure 6: AM Travel Times from US 17 Bypass to US 501/SC 22

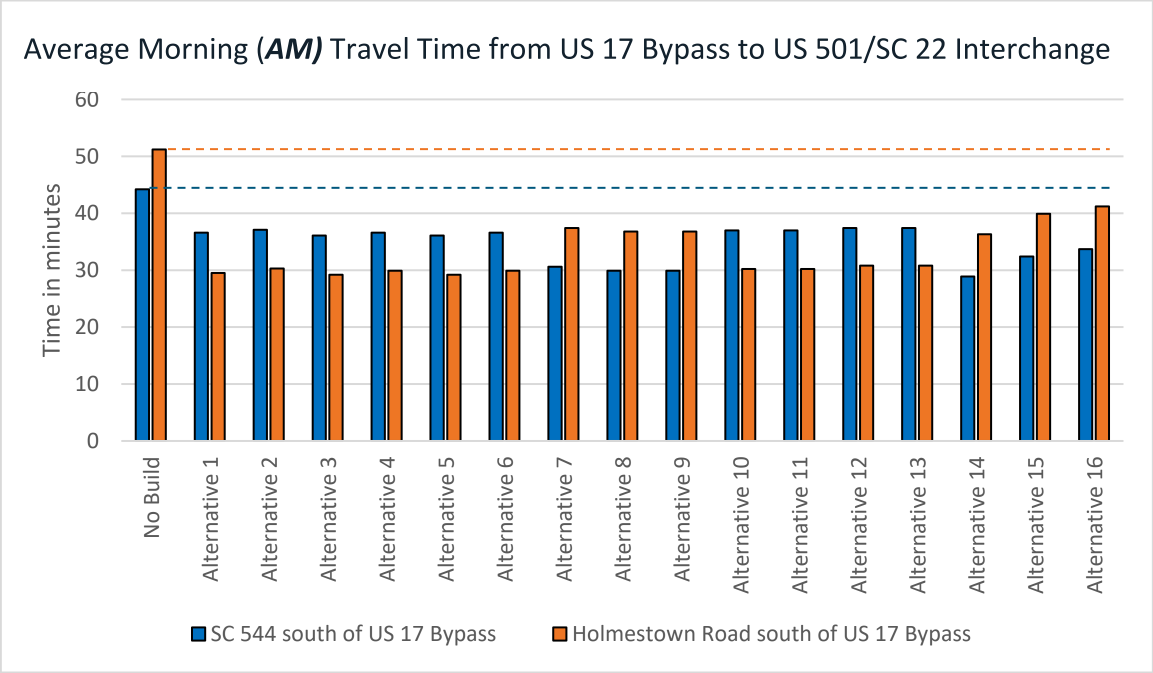

Figure 7: PM Travel Times from US 17 Bypass to US 501/SC 22 shows the average PM travel time from US 17 Bypass to US 501/SC 22 using either SC 544 south of US 17 Bypass or Holmestown Road south of US 17 Bypass. The No Build has the highest PM travel time for both routes than any of the alternatives. The new location alternatives (Alternatives 1 through 13) have a lower travel time from US 17 Bypass to US 501/SC 22 compared to the widening of existing location alternatives (Alternatives 14 through 16). The PM travel time is significantly less in the new location alternatives when utilizing Holmestown Road south of US 17 Bypass and have a decreased travel time of at least 13.4-58.7 minutes when compared to the widening of existing location alternatives. Overall, all 16 alternatives would save at least of 26.9 minutes utilizing SC 544 to travel from US 17 Bypass to US 501/SC 22 and 10 minutes utilizing Holmestown Road to travel from US 17 Bypass to US 501/SC 22.

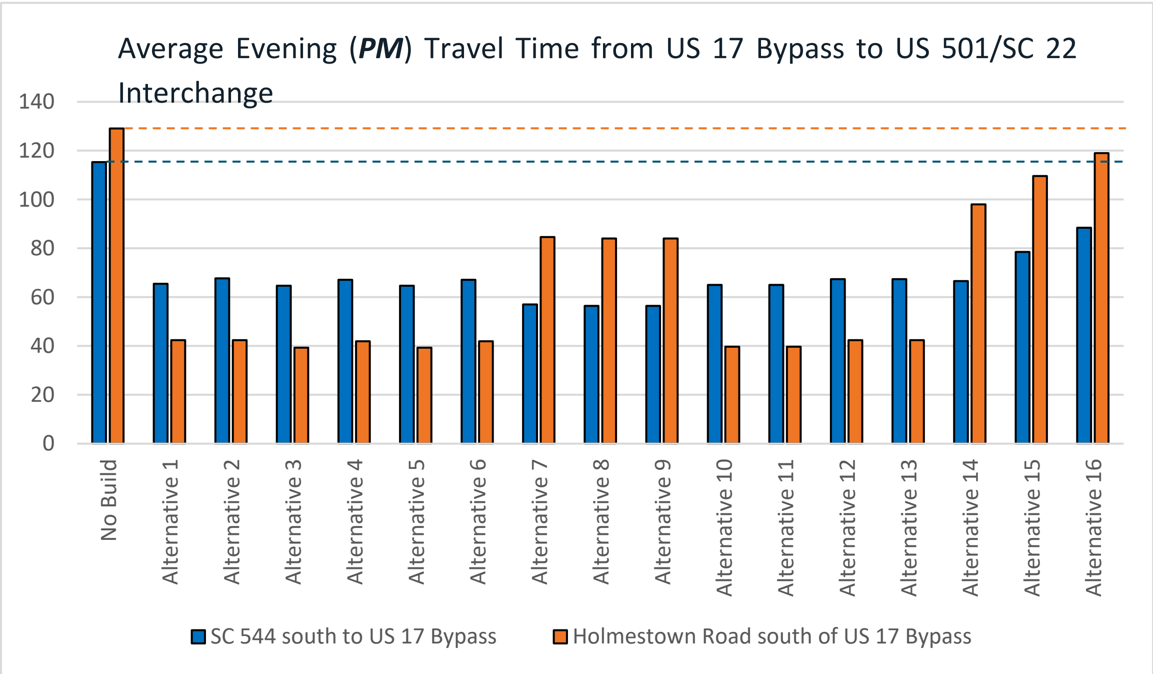
Figure 7: PM Travel Times from US 17 Bypass to US 501/SC 22



5.3 Level of Service

Level of Service (LOS) is a term used to qualitatively describe the operating conditions of a roadway based on factors such as speed, travel time, maneuverability, delay, and safety. LOS of C or better is preferred for transportation projects. For this analysis, the various LOS ratings can be described and understood as follows:

LOS A: Free flowing conditions with low traffic volumes traveling at free flow speeds with unimpeded maneuverability.

LOS B: Nearly free flow condition with traffic generally moving at free flow speeds with slightly impeded maneuverability.

LOS C: Stable flow at or near free flow speeds; increased traffic density begins to restrict maneuverability.

LOS D: Approaching unstable flow conditions with limited maneuverability.

LOS E: Unstable flow moving at slower speeds with very limited to no maneuverability; traffic volumes are approaching roadway capacity.

LOS F: Flow is unstable and slow-moving with frequent stops and traffic back-ups; traffic demand exceeds roadway capacity.

Table 2 shows the maximum LOS for the SELL alternatives, new alignment and existing, as well as Conway Perimeter Road (El Bethel Road) to New Road to US 501. The SELL Alignment LOS are separated into the new alignment segments and segments where a proposed SELL alternative incorporates existing arterial roadways. For example, Alternatives 1, 3, 5, 10, and 11 make use of Holmestown Road, while Alternatives 14 through 16 make use of various segments of SC 544, US 501 and/or Conway Perimeter Road.

Table 2: SELL Alignments and Conway Perimeter Road Maximum LOS

Segments	No Build	ALT 1	ALT 2	ALT 3	ALT 4	ALT 5	ALT 6	ALT 7	ALT 8	ALT 9	ALT 10	ALT 11	ALT 12	ALT 13	ALT 14	ALT 15	ALT 16
SELL (New Alignment)	-	C	D	C	C	C	C	F	F	F	C	C	C	C	F	E	-
SELL (Existing Alignment)	-	F	-	F	-	F	-	-	-	-	F	F	-	-	F	F	F
Conway Perimeter Road	D	B	B	B	B	B	B	B	B	B	B	B	B	B	E	E	C

Based on the LOS shown above, new alignment Alternatives 1, 3 through 6, and 10 through 13 have LOS C, indicating stable flow at or near free flow speeds, but with increased traffic density that begins to restrict maneuverability. New alignment Alternatives 7 through 9 and 14 through 15 result in LOS E or F which indicates unstable traffic flow with high density traffic and frequent traffic back-ups. All existing alignment alternatives have LOS F indicating unstable flow with the traffic demand exceeding roadway capacity. Alternatives 1 through 13 and Alternative 16 help to raise the LOS to LOS B, relieving traffic and congestion on Conway Perimeter Road and creating nearly free flow conditions with traffic generally moving at free flow speeds. Alternatives 14 and 15 result in a LOS E that creates unstable flow conditions and lower traffic speeds.

5.4 Hurricane Evacuation

Hurricane evacuation preparation is a key focus for Horry County to plan for the evacuation of both residents and visitors in the region during storm events. Due to the last hurricane evacuation study for this project being conducted in 2007, an updated study was performed in 2022 utilizing dynamic traffic assignment (DTA) to provide an updated assessment of evacuation behavior and routing simulation to better evaluate the current alternatives for SELL; see **Appendix C: Hurricane Evacuation Report**. Behavioral assumptions as well as roadway assumptions were made during modeling and the key assumptions are listed below:

- US 501 lane reversals are included at SC 544 to SC 378 and from SC 22 to the US 501/SC 576 split in Marion.[4]
- Evacuees are modeled to utilize all routes out of the network to maximize use of the road network and to most accurately model evacuee behavior.
- Evacuees are modeled to either go to a shelter zone or go to a destination zone outside of the GSATS network.
- An 8-hour response time is included within the clearance time to simulate the preparation period for evacuees to pack and enter the network.[5]

Two scenarios were modeled based on how the zones were evacuated. The scenarios of focus were staggered evacuations of zones A, B and C; and simultaneous evacuations of Zones A, B, and C. The staggered assessment modeled the evacuation of all three zones with staggered leave or departure times. This environment assumes that vehicles from all evacuation zones enter the road network at differing times. The simultaneous assessment modeled the evacuation of all three zones with a simultaneous leave time, assuming a "worst case" scenario where all vehicles enter the network at the same time. These scenarios were modeled to determine the clearance time for each alternative. Clearance time is defined as the amount of time from when the first person enters the road network to the last person leaves the network. The network is defined as the boundary of the GSATS network arriving at a hurricane shelter or arriving at a destination outside of the network.

The clearance times differ from previous studies due to differences in the type of modeling conducted as well as the difference in destination points. The previous Hurricane Evacuation Study published in 2007 utilized the Abbreviated Transportation Model tool for modeling the evacuations and determining the clearance times while for this study the TRANSIMS modeling tool utilized the results of the GSATS 2040 Travel Demand Model. The previous study also determined the destination zones to be out of the county or within the county to local residences and hotels while the current study determined destinations to be shelter zones (11 within the region and 5 outside the region located at the edges of the GSATS Travel Demand Model network). The differences in

---

[4] Currently, reversing the existing roads (US 501) cause tremendous difficulties for Public Safety and other Governmental functions to continue during evacuation. Having an alternative route would make great improvements in preparing for a storm evacuation.

[5] Annex C to Hurricane Plan Evacuation Zones and Clearance Timing. https://www.scemd.org/media/1332/annex-c-evacuation-zones-and-clearance-timing.pdf

modeling along with the differences in destination points account for the clearance time variations seen between previous studies and the current study. **Table 3: Clearance Times for SELL Alternatives** shows clearance times for the staggered and simultaneous scenarios for each alternative compared to the No-Build.

Table 3: Clearance Times for SELL Alternatives

Alternative	Staggered Scenario Clearance for Zones A-C (hours:minutes)	Simultaneous Scenario Clearance for Zones A-C (hours:minutes)
No-Build	27:39	15:46
Alternative 1	26:36	15:50
Alternative 2	26:44	15:33
Alternative 3	26:47	15:15
Alternative 4	26:50	15:34
Alternative 5	26:47	15:15
Alternative 6	26:50	15:34
Alternative 7	26:50	15:40
Alternative 8	26:47	15:55
Alternative 9	26:47	15:55
Alternative 10	26:48	15:24
Alternative 11	26:48	15:24
Alternative 12	26:47	15:09
Alternative 13	26:47	15:09
Alternative 14	26:53	15:49
Alternative 15	27:11	16:24
Alternative 16	27:02	15:58

The modeling conducted shows clearance times decreased by at least 37 to 63 minutes when compared to the No Build alternative for the staggered scenario, see **Figure 8: Clearance Times for Staggered Evacuation Scenario**. For the simultaneous scenario, Alternatives 2-7, and 10-13 have decreased clearance times when compared to the No Build, see **Figure 9: Clearance Times for Simultaneous Evacuation Scenario**.

Figure 8: Clearance Times for Staggered Evacuation Scenario

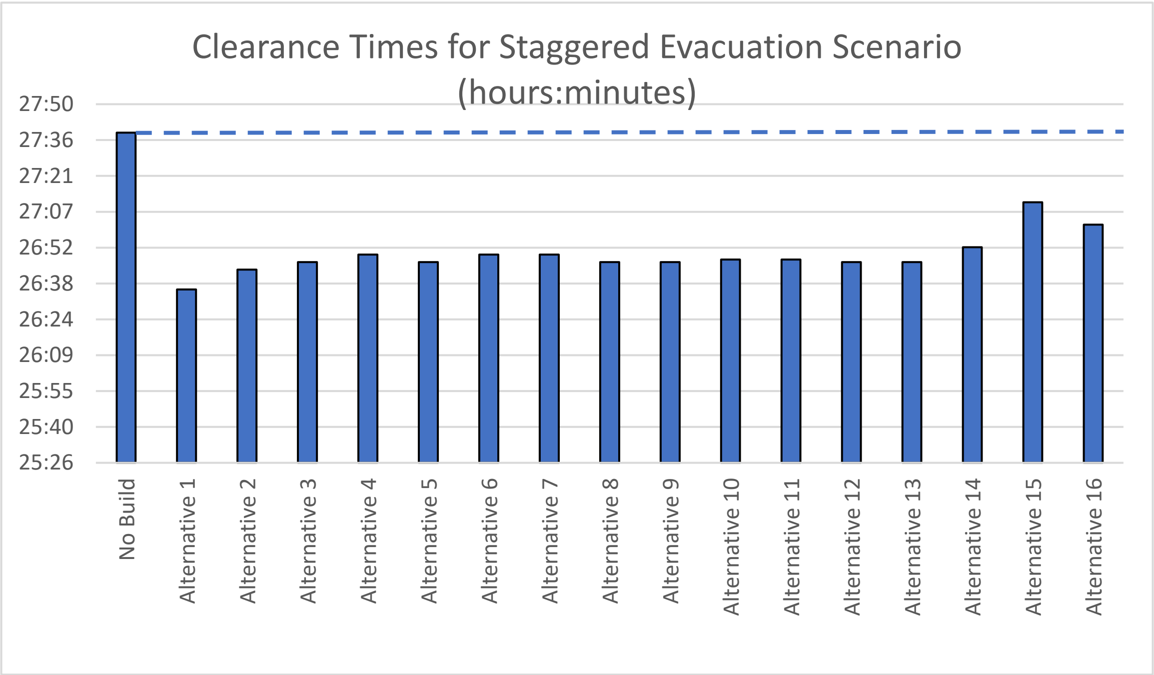


Figure 9: Clearance Times for Simultaneous Evacuation Scenario

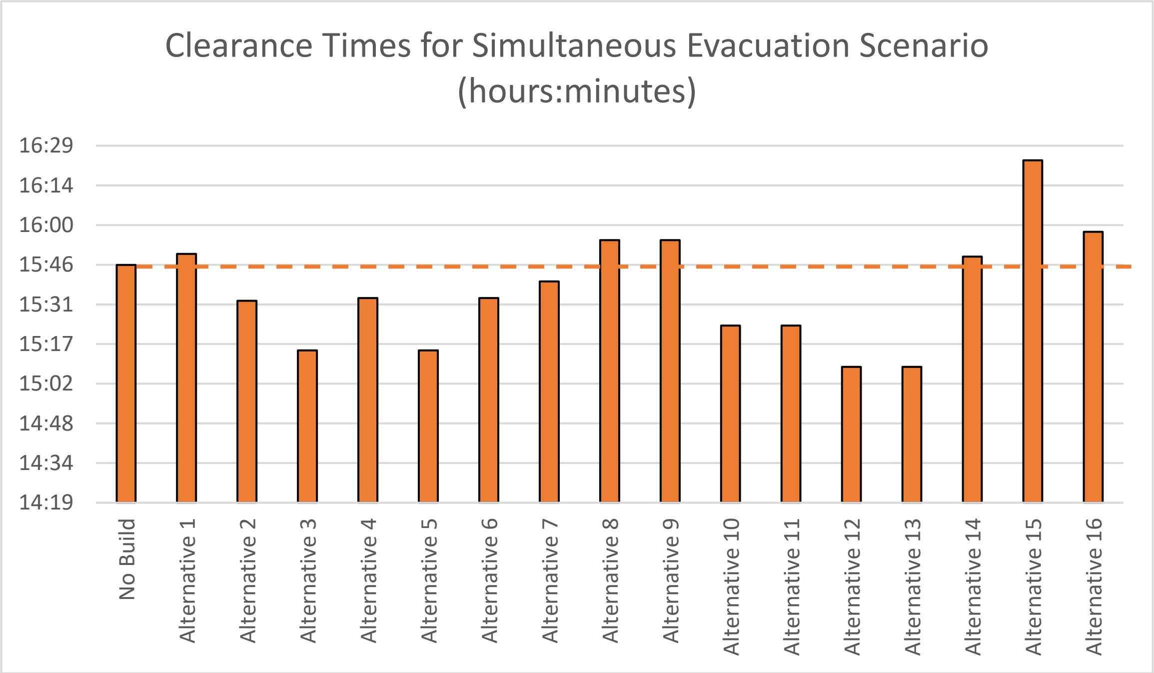

Overall, the new location alternatives (Alternatives 1 through 13) result in decreased clearance times for the staggard evacuation scenario when compared to the No Build alternative. The widening of existing location alternatives (Alternatives 14 through 16), which include widening of existing US 501 and SC 544, result in decreased clearance times for the staggered evacuation scenario. For the simultaneous evacuation scenario, Alternatives 1, 8-9, and 14-16 result in a clearance time increase when compared to the No Build alternative.

Why are we seeing an increase in travel time for Alternatives 1,8,9,14,15,16. 14-16 since its widening? But 1,8-9

5.5 Alternatives Environmental Impacts Overview

An environmental impact matrix is included in **Table 4: Environmental Impact Matrix** for each reasonable alternative and the No-build, summarizing the potential impacts to environmental resources. An approximate 300-foot wide corridor was assessed for each alternative. To more precisely estimate impacts to Waters of the U.S. (WoUS) and relocations, more refined corridors based on approximate construction limits were utilized.

The estimated costs for each alternative represent the construction cost projected to the year 2033. Engineering design, right of way acquisition, construction inspection, mitigation and utility relocations are not included in these estimates. A more detailed discussion of environmental resources and their related impacts are included in sections 6 through 19.

Table 4: SELL Environmental Conceptual Impacts Matrix

Alternatives	Waters of the US		Waccamaw National Wildlife Refuge (acres)	Relocations	Cultural Resources	Parks and Recreation Areas	Hazardous Materials Sites	Environmental Justice Communities	Construction Cost*
	Wetland & Pond acres	Stream feet							
1	274.9	9,474	0	85	1	No	11	25	$881,900,000.00
2	290.9	10,422	0	72	1	No	7	28	$928,900,000.00
3	311.4	14,610	0	71	0	No	4	15	$872,500,000.00
4	327.1	15,558	0	64	1	No	0	18	$920,100,000.00
5	255.6	15,016	0	78	0	No	4	16	$893,400,000.00
6	271.3	15,964	0	61	1	No	0	19	$940,900,000.00
7	265.0	13,625	74.37	40	0	Yes	2	16	$904,500,000.00
8	273.4	7,456	74.37	71	2	Yes	10	37	$883,900,000.00
9	276.5	7,459	74.37	94	4	Yes	10	26	$890,000,000.00
10	272.1	8,991	0	100	0	No	12	37	$901,200,000.00
11	275.4	8,991	0	160	0	No	12	27	$951,300,000.00
12	287.5	9,939	0	87	1	No	8	45	$948,800,000.00
13	291.1	9,939	0	110	0	No	8	34	$954,700,000.00
14	76.8	1,578	7.98	94	3	Yes	97	55	$553,300,000.00
15	68.3	1,713	0	108	6	Yes	127	63	$641,300,000.00
16	14.8	1,578	0	98	10	Yes	199	30	$380,100,000.00

The estimated costs for each alternative represent the construction cost projected to the year 2033. Engineering design, right of way acquisition, construction inspection, mitigation and utility relocations are not included in these estimates. A more detailed discussion of environmental resources and their related impacts are included in sections 6 through 19.

6 NATURAL RESOURCES OVERVIEW

The purpose of this natural resources evaluation is to document natural resources and to summarize potential conceptual-level impacts to wetlands, federal and state protected species, and protected habitats. Measures considered to avoid, minimize, and mitigate for potential impacts are also discussed. Natural resources within the PSA were identified based on a review of existing available data from various state and federal agencies (SCDNR, USDA, NRCS, etc.), Geographic Information System (GIS) databases, and WoUS data. Limited field reviews have been conducted at this phase. Specific information regarding data sources, methodology, and potential impacts are presented within the discussion of each resource.

6.1 Potential Impacts to Threatened, Endangered, or Special Status Species

This assessment analyzes potential impacts to federally endangered and threatened species associated with the proposed project. Species with the federal classification of Endangered or Threatened are protected under the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 et seq.). The term "endangered species" is defined as "any species which is in danger of extinction throughout all or a significant portion of its range," and the term "threatened species" is defined as "any species which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range" (16 U.S.C. 1532).

The term "Proposed" is defined as "any species proposed for official listing as endangered or threatened." The United States Fish and Wildlife Service (USFWS) designation of proposed does not provide federal protection and require no Section 7 consultation under the ESA, however it often indicates that official species classification is imminent.

The bald eagle is no longer protected under the ESA but is afforded federal protection through the Bald and Golden Eagle Protection Act (BGEPA) of 1940. Animal species that are on the South Carolina state protected species list receive protection under the South Carolina Nongame and Endangered Species Conservation Act (South Carolina Code, Title 50). State endangered species are defined as any species or subspecies of wildlife whose prospects of survival or recruitment within the state are in jeopardy or are likely to be in jeopardy within the foreseeable future. It is unlawful for any person to take, possess, transport, export, process, sell or offer for sale or ship, and for any common or contract carrier knowingly to transport or receive for shipment any species or subspecies of wildlife appearing on the state list of protected species without appropriate authorization.

State listed species are gathered from the South Carolina Department of Natural Resources (SCDNR). **Appendix E: Natural Resources Technical Memorandum** includes a USFWS List of Federally Protected Species in Horry County and a USFWS Information for Planning and Consultation (IPaC) List of Federally Protected Species in the PSA. Impact potential for protected species are summarized in **Table 5: Potential for Impacts on Threatened and Endangered Species**.

Table 5: Potential for Impacts on Threatened and Endangered Species

Species	Protection Status	Probability For Potential Substantial Impacts
Atlantic sturgeon (*Acipenser oxyrinchus*)	Endangered	Low
Shortnose sturgeon (*Acipenser brevirostrum*)	Endangered	Low
Finback Whale (*Balaenoptera physalus*)	Endangered	Low
Humpback whale (*Megaptera novaengliae*)	Endangered	Low
Right whale (*Balaena glacialis*)	Endangered	Low
Sei whale (*Balaenoptera borealis*)	Endangered	Low
Sperm whale (*Physeter macrocephalus*)	Endangered	Low
American chaffseed (*Schwalbea americana*)	Endangered	Medium
Kemp's ridley sea turtle (*Lepidochelys kempii*)	Endangered	Low
Leatherback sea turtle (*Dermochelys coriacea*)	Endangered	Low
American wood stork (*Mycteria americana*)	Threatened	Medium
Piping plover (*Charadrius melodus*)	Threatened	Medium
Red-cockaded woodpecker (*Picoides borealis*)	Threatened	Medium
Red knot (*Calidris canutus rufa*)	Threatened	Low
Northern long-eared bat (*Myotis septentrionalis*)	Threatened	Medium
Tricolored bat (*Perimyotis subflavus*)	Endangered (proposed)	Medium
West Indian manatee (*Trichechus manatus*)	Threatened	Low
Seabeach amaranth (*Amaranthus pumilus*)	Threatened	Low
Green sea turtle (*Chelonia mydas*)	Threatened	Low
Loggerhead sea turtle (*Caretta caretta*)	Threatened	Low
Bald eagle (*Haliaeetus leucocephalus*)	BGEPA	Low

Due to the preliminary stage of analysis for the SELL project, no field reviews were conducted within each alternative corridor. A desktop review for any observed sighting of Federal or State listed protected species was conducted (December 2022) using the South Carolina Natural Heritage Database. The PSA was analyzed within the context of all 16 alternative corridors. Potential effects to critical habitat overlap were identified within the PSA for the piping plover.

Based on initial desktop review, several known records of protected species were identified. These include the following:

1. Bald Eagle was observed in 2022 at Lake Busbee, within 1 mile of Alternative Corridors 14-16.
2. American chaffseed was observed in 1954 (possibly extirpated now) just east of SC 544 and just south of US 378. This observed sighting is located right within Alternative Corridors 15 and 16. Another American chaffseed sighting was observed in 1985 (possibly historic) west of US 17 and just south of Freewoods Road. No alternative corridor is located at this sighting.

3. A Rafinesque's big-eared bat (*Corynorhinus rafinesquii*) roost was observed in 2022 along US 701 at the southernmost portion of the PSA. No alternative corridor is located at this location. This is a state endangered species.
4. The red-cockaded woodpecker (RCW) is documented to occur in Horry County. There were two recorded sightings within two miles of the study area: in Brookgreen Gardens and on Sandy Island in 2008. During preliminary field investigations, RCW populations were identified on the Grand Strand Water and Sewer Authority property near Bucksport in 2008. Information regarding active colonies was collected during multiple field investigations and used to shift previous alternative alignments.

Migratory birds that are of concern either because they occur on the USFWS Birds of Conservation Concern list or warrant special attention in the PSA were identified. Forty-two bird species were noted and can be found in **Appendix E: Natural Resources Technical Memorandum.**

The potential direct upland impacts to plant species may occur during construction and include excavation and fill to accommodate the roadway footprint and temporary or permanent clearing of the roadway and right-of-way. The potential indirect upland impacts may result from mowing and other maintenance, utility installation, and increased development. Habitat reduction and fragmentation would result from both direct and indirect impacts. Impacts to upland plant communities from highway construction could include:

- Conversion of mature and forested plant communities to edge or regularly disturbed communities
- Introduction and spread of invasive, exotic species that are adapted to early-successional (or disturbed) habitats
- Dust and sediment settling that reduces the rates of photosynthesis and respiration
- Changes in soil chemistry due to chemical deposition from highway runoff and airborne substances
- Fragmentation of habitat that restricts reproduction and spread of native plant and animal species
- Reduction in pollination and seed dispersal resulting from impacts to associated faunal species

The potential direct upland impacts to wildlife within upland communities include habitat loss and fragmentation. Wildlife populations may also experience disruptions in mating, feeding, or migratory patterns due to habitat disturbance and road noise. Short-term displacement of wildlife populations will likely result during roadway construction for species who are habituated to human activities and disturbances and are expected to return following construction. Larger species requiring large, contiguous and undisturbed habitat such as the American black bear (*Ursus americanus*) may be permanently displaced and additional study with refined alternatives would be required.

6.2 Potential Impacts to Waters of the U.S.

A desktop survey utilizing available mapping resources along with limited field verification reviews was conducted for each alternative corridor for the presence of potential Waters of the U.S. (WoUS) during March and April 2021. The purpose of this task was to identify potential WoUS that could be incorporated into a preliminary alternative analysis to evaluate preliminary impacts. This evaluation captured potential WoUS based on Charleston District U.S. Army Corps of Engineers (USACE) guidelines for a preliminary jurisdictional determination

(PJD). These aquatic features were assessed based on the "Revised Definition of Waters of the United States," published on January 18, 2023 and effective March 20, 2023 (33 CFR Part 328). The desktop delineation process included the initial identification of aquatic resources including wetlands, streams, open waters, nonaquatic linear conveyances, and potential low flow channels. Subsequent wetland delineations and jurisdictional determinations will be appropriately conducted as the project progresses. Impacts to WoUS are summarized in **Table 6: Estimated WoUS Impacts within each Alternative Corridor**.

Table 6: Estimated WoUS Impacts within each Alternative Corridor

Alternative	Wetland (Acres)	Stream (Linear Feet)	Open Water (Acres)
1	273.8	9,474	1.1
2	289.4	10,422	1.5
3	310.7	14,610	0.7
4	326.1	15,558	1.0
5	254.9	15,016	0.7
6	270.3	15,964	1.0
7	260.9	13,625	4.1
8	269.2	7,456	4.2
9	272.2	7,459	4.3
10	271.3	8,991	0.8
11	274.4	8,991	1.0
12	286.3	9,939	1.2
13	289.8	9,939	1.3
14	74.8	1,578	2.0
15	66.3	1,713	2.0
16	14.7	1,578	0.1

There is a wide variety of WoUS within the PSA freshwater including wetlands, braided wetland/stream complexes, coastal plain streams, estuarine waters, and ponds. Quality, function, and value of WoUS would be assessed on the final range of proposed alternatives so that avoidance and minimization can be maximized.

It is anticipated that the SELL project will require an Individual Permit (IP) due to the level of impacts anticipated to WoUS. In addition, a Section 401 Water Quality Certification, Navigable Waters Permit, a USACE Permit for 404 Discharges, and South Carolina Department of Health and Environmental Control, Office of Ocean and Coastal Resource Management (SCDHEC-OCRM) Costal Zone Consistency Certification are anticipated. In its evaluation of permit applications to discharge dredged or fill material into WoUS, including wetlands, the USACE is required to analyze alternatives to the proposed project that could achieve its purpose and need. Practicable means that the alternative is able to achieve the overall project purpose, and is also feasible considering three primary factors: cost, logistics, and/or existing technology. These conditions would be discussed in detail following public engagement and a forthcoming permit application to the USACE.

Potential direct impacts to wetlands, streams, and open waters in the PSA may include excavation, fill to accommodate the roadway footprint, temporary or permanent clearing of the roadway and right-of-way, culvert installation, and drainage improvements. Indirect impacts may result from mowing and other maintenance, utility installation, and induced growth. Direct and indirect impacts to wetlands, streams, and open waters could include:

- Conversion to other community types including uplands such as urban land use/impervious surface
- Loss of wetland functions and values, including alterations in surface and sub-surface water storage and retention, reduced pollutant uptake and filtration, and reduced habitat and wildlife diversity
- Water quality degradation of streams and open waters through point and nonpoint source pollution

6.3 Potential Impacts to Water Quality

In accordance with Section 303(d) of the 1972 Federal Clean Water Act (CWA), SCDHEC evaluates water bodies identified as impaired for appropriate inclusion on the Section 303(d) list. The 303(d) list is a State list of waters that are not meeting water quality standards or have impaired uses. The 303(d) list targets water bodies that do not meet water quality standards set for the state for water quality management, as well as identifying the cause(s) of the impairment and the designated classifications. A TMDL, or Total Maximum Daily Load, is the amount of a single pollutant (e.g., bacteria, nutrients, metals) that can enter a waterbody on a daily basis and still meet water quality standards set forth by the State. "TMDL" refers to both the calculation of a pollutant entering a waterbody, as well as a document which includes this calculation along with source assessments, watershed and land use information, reductions and allocations information, implementation and other relevant information, maps, figures and pictures. The TMDL parameter measured within the project boundaries is dissolved oxygen (DO). There are 20 water quality stations within the PSA with 18 stations having an SCDHEC 303(d) listing of Impaired; two are not listed; see **Appendix E: Natural Resources Technical Memorandum.**

Due to the existing water quality impairments, a TMDL is approved within the PSA watershed under the DO parameter. SCDHEC may require additional water quality protection and stormwater treatment measures during and after construction. However, the proposed project is not anticipated to contribute to these impairments or have long term impacts on water quality within the impaired watersheds. During construction activities, temporary siltation may occur in adjacent waters and erosion may occur at a more rapid rate. It is recommended that the contractor minimize this impact through implementation of construction best management practices, reflecting policies contained in 23 CFR 650 B and S.C. Code of Regulations 72-400. The SCDOT has also issued an Engineering Directive Memorandum (Number 23), dated March 10, 2009, regarding Department procedures to be followed in order to ensure compliance with S.C. Code of 72-400, Standards for Stormwater Management and Sediment Reduction. Exposed areas may be stabilized by following the Department's Supplemental Technical Specification for Seeding (SCDOT Designation SC-M-810 (11-08)).

The groundwater resources located within the PSA come from the Southeastern Coastal Plain Aquifer System. The PSA includes four hydrogeologic systems Surficial Aquifer, Black Creek Aquifer, Middendorf Aquifer, and the Cape Fear Aquifer. Many individuals within the PSA who have private wells rely on the Surficial Aquifer. Historically, the Black Creek Aquifer has been the most important source of groundwater in Horry and Georgetown Counties, and is used extensively for municipal, industrial, and domestic water supplies. The water quality is generally considered good; however naturally elevated levels of fluoride, chloride, and sodium have reduced water consumption in some locations. The Middendorf Aquifer is not generally utilized as often due to the presence of the more shallow and economically accessible aquifers above it (the Black Creek Aquifer and the Surficial Aquifer). Very few wells utilize the Cape Fear Aquifer due to the same reasons and therefore little is known about this aquifer.

Potential point and nonpoint source pollution impacts could occur to groundwater resources. Construction activities may expose groundwater resources, leading to potential inputs of pollutants, such as sediment and petroleum. Inputs of point and nonpoint source pollution may lead to decreased water quality of ground water.

6.4 Potential Impacts to Soils

At 1,134 square miles, Horry is the largest county in South Carolina by land mass and is comprised of predominantly undeveloped land including mixed pine forests, riverine forest systems, and pine plantations in various stages of development including clear-cuts, seedlings and mature stands; see **Appendix E: Natural Resources Technical Memorandum**. The PSA is generally located in the southwestern portion of Horry County. The origins of soil parent material are the unconsolidated material in which a soil forms. It determines the mineral and chemical composition of the soil. The parent materials in the soils of Horry County are marine or fluvial deposits, which contain varying amounts of sand, silt, and clay. Thirty-three different soils were identified in common among all 16 alternatives, in addition to other various soils specific to each alternative.

The project will have both short-term construction-related impacts, as well as long-term operational impacts on soils in the PSA; however, these impacts are not considered substantial.

7 FLOODPLAINS

Floodplain and floodway protection are required under several federal, state, and local laws, including Executive Order 11988 entitled “Floodplain Management,” which requires federal agencies to avoid making modifications to and supporting development in floodplains wherever practical. The Federal Emergency Management Agency (FEMA) administers the National Flood Insurance Program. Floodplains subject to inundation by the one percent-annual-chance (100 year) flood event are regulated by FEMA. Based upon a review of the floodplain mapping and a GIS analysis of the PSA, each of the 16 alternative corridors cross FEMA-regulated Zone A floodplains, Zone AE floodplains, and regulated floodways. Zone A is an area subject to inundation by the 1% annual chance flood event determined using approximate methodologies. Zone AE indicates that the water surface elevations were determined using detailed hydrologic and hydraulic analyses. Regulated floodways have an established floodway elevation and width that is determined through detailed studies.

In accordance with Executive Order 11988, a hydraulic analysis must be conducted for an encroachment of a FEMA-regulated floodplain. The hydraulic analysis is used to determine if the project is likely to increase the risk of flooding within the floodplain. To meet the requirements of a "No-Rise" condition, FEMA requires projects which would encroach on Regulated Floodways and floodplains to result in a change no greater than 0.1 feet from the established 100-year flood elevations. Furthermore, SCDOT requires all Zone A crossings to be analyzed for the 100-year flood to ensure that the floodplain encroachment does not cause one foot or more of backwater when compared to unrestricted or natural conditions.

7.1 Impacts to Floodplains

The encroachment of the FEMA-regulated floodplains within the PSA are not anticipated to increase the risk of flooding within these floodplains and the proposed project would be designed to meet the "No-Rise" requirements. A preliminary hydraulic analysis will be performed for each encroachment of a FEMA-regulated floodplain and a detailed hydraulic analysis will be performed during final design, see **Appendix F: Floodplain Checklist**.

8 FARMLANDS

The Farmland Protection Policy Act of 1981 (FPPA) was enacted by Congress to minimize the unnecessary and irreversible conversion of farmland soils to nonagricultural uses, and to assure, to the extent practicable, that federal, state, and local policies are used to protect farmland soils. Farmland soils can be prime farmland soils, unique farmland soils, or farmland soils of statewide or local importance. Prime farmland soils are defined as soils that consistently produce the greatest yields with minimal inputs of energy and economic resources, and farming these soils involves the least environmental impact.

The U.S. Department of Agriculture (USDA)/Natural Resource Conservation Service (NRCS) Web Soil Survey was evaluated and a Custom Soil Resource Report for farmlands was obtained for the SELL PSA, specifically for within the 16 alternative corridors (**Appendix G: Farmlands and Soil Resource Report**). The alternative corridors contain soils classified as prime farmland and farmland of statewide importance; herein simply noted as farmland. Portions of the alternative corridors are also considered "Not prime farmland" by the U.S. Web Soil Survey and the soils are classified as urban land (UR). According to the U.S. Census Bureau, Alternatives 8 through 16 cross the Myrtle Beach-Socastee, SC-NC Urbanized Area.[6] According to the FPPA, a project is not subject to FPPA review if the affected land is in an urbanized area, within a municipal boundary, or the adjacent area is in urban use. Portions of these alternatives meet this condition.

[6] U.S. Census Bureau. (2012, March 12). 2010 Census Urbanized Area Reference Map: Myrtle Beach-Socastee, SC--NC. Retrieved December 14, 2022, from https://www2.census.gov/geo/maps/dc10map/UAUC_RefMap/ua/ua60895_myrtle_beach--socastee_sc--nc/DC10UA60895.pdf

8.1 IMPACTS TO FARMLANDS

Because the alternative corridors contain soils classified as FPPA farmlands, the proposed project has the potential to convert important farmland to nonfarm use. Therefore, NRCS's Farmland Conversion Impact Rating for Corridor Type Projects form (form NRCS-CPA-106) was completed for all portions that are not in a municipal boundary or urban area (see **Appendix G** for all farmland conversion forms). The areas within each alternative corridor that fell within a municipal boundary or urban area (the Horry County Municipal Boundaries) were not quantified/included in farmland impacts calculations. For the farmland conversion form, impacts were broken down into direct and indirect impacts based on the proposed conceptual design. Direct impacts were calculated based on where farmlands exist within a 10-foot-buffer of the final travel way line based on conceptual design. The indirect impacts were based on the outside edge of the travel way buffer to the alternative corridor boundary for each alternative.

The NRCS farmland conversion form is used to determine if notable farmland conversion impacts are anticipated. The total score is comprised of (1) the relative value of farmland score and (2) the corridor assessment criteria score. The relative value of farmland (to be converted by the referenced alternative) score is assessed on a scale of 0 to 100 and is completed by NRCS; therefore, it is assumed to be 100 points for all alternatives. The corridor assessment criteria score pertains to the use of land, the availability of farm support services, investments in existing farms, and the amount of land that could be rendered nonfarmable due to construction of the proposed project. The total corridor assessment has a scale of 0 to 160 points. Sites/corridors receiving highest scores up to a maximum of 260 (for the two parts) are considered most suitable for protection while those with the lowest scores are considered least suitable. Corridors receiving scores less than the maximum allowable score of 160 are to be given minimal consideration for FPPA protection. Therefore, if the total score is less than the threshold score of 160 established by NRCS, the project area is not considered a priority for protection nor are alternative sites or additional studies required under the FPPA. Refer to **Appendix G** for the Farmland Impact Conversion Rating Forms (NRCS-CPA-106) for each alternative and the NRCS Soil Resource Report for the project.

As indicated in the forms in **Appendix G**, the preliminary corridor assessment criteria analysis resulted in a score of 73 to 80 for all alternatives, and the relative value of farmland is assumed to be 100 for a total score of 173 to 180 for the project alternatives. This total score, as shown in **Table 7: Farmland Impacts for each Alternative**, is greater than the NRCS affect threshold score of 160. However, based on an agreement with NRCS and SCDOT, if a site's corridor assessment score is less than 100, no additional assessment by the NRCS district office would be necessary. Therefore, no further coordination with NRCS or mitigation is required. As such, these sites are considered least suitable, and the alternative corridors would not be considered a priority for protection and no alternative sites nor additional studies are required under the FPPA. Total amount of FPPA farmlands, impacts to farmlands, and the total impact conversion rating score was quantified for each alternative, and is shown in **Table 7: Farmland Impacts for each Alternative**.

Table 7: Farmland Impacts for each Alternative

Project Alternatives	Total amount of FPPA farmland (acres) in corridor	Direct farmland impact (acres)	Indirect farmland impact (acres)	Total farmland impacts (acres)	Farmland conversion impact rating total score
1	819	305	380	685	180
2	831	315	391	706	180
3	826	326	368	694	180
4	838	335	379	714	180
5	887	323	426	749	180
6	898	336	435	771	180
7	772	300	330	630	180
8	779	234	363	598	180
9	777	238	364	602	180
10	930	304	479	783	180
11	929	305	483	788	180
12	942	311	492	803	180
13	941	311	497	808	180
14	144	5	16	21	176
15	161	4	13	17	176
16	149	2	10	12	173

Based on the analysis, all alternatives would impact farmlands, but Alternatives 14, 15, and 16 would result in the fewest impacts, primarily due to a large portion of the corridors crossing the Myrtle Beach-Socastee Urbanized Area and the adjacent future Conway Perimeter Road Project utilized by Alternatives 14 and 15. The Conway Perimeter Road project is an existing committed project with funding that is assumed to be built, therefore, no impacts are calculated within that project area.

9 HAZARDOUS MATERIALS

A hazardous material is one that is considered explosive, flammable, toxic, poisonous, corrosive, oxidizing, irritating or otherwise harmful and is likely to be damaging to human health or the environment. If a designated quantity of any of these substances is spilled or released into the environment, it must be reported to the USEPA.

Many types of businesses generate hazardous wastes including service stations, hospitals, dry cleaners, auto repair shops, exterminators, petroleum companies and chemical manufacturers. The Resource Conservation and Recovery Act (RCRA) of 1976 created a hazardous waste management system to regulate businesses including local, state and federal government facilities that generate, transport, treat, store, or dispose of hazardous waste materials. Each entity is regulated to ensure proper management of hazardous material from the moment it is generated until its ultimate disposal or destruction. The RCRA only regulates active and non-historical sites. In 1980, the Comprehensive Environmental Response, Compensation, and Liability Act or Superfund was created to protect individuals and communities from heavily contaminated toxic waste sites that had been abandoned. The Hazardous and Solid Wastes Amendments Act was added in 1984 and in 1986 the law was expanded further to regulate underground storage tanks and other leaking waste storage facilities.

Federal and state databases of environmentally regulated sites are maintained by the SCDHEC. Sites with documented contamination, as well as those that are potential sources of contamination were identified. These sites are documented as falling into one of the following categories:

- Underground Storage Tanks (USTs): An UST is a tank and any underground piping connected to the tank and can hold petroleum or other hazardous materials.
- Leaking Underground Storage Tanks (LUSTs): A UST that is currently or has previously been documented leaking petroleum or other hazardous materials.
- Aboveground Storage Tanks (ASTs): An AST holding oils of any kind or other hazardous materials.
- Hazardous Waste Generators: A generator is any person who produces a hazardous waste as listed or characterized in 40CF part 261 of title 40. The volume of hazardous waste each generator produced in a calendar month determines which regulations apply to that generator. If the quantity of hazardous waste produced in a month is small, they are categorized as small quantity generators. If the quantity of hazardous waste produced in a month is large, they are categorized as large quantity generators.
- Hazardous Waste Treatment, Storage, and Disposal sites (TSD): TSD facilities provide temporary storage and final treatment or disposal for hazardous wastes. Since they manage large volumes of waste and conduct activities that may present a higher degree of risk, TSD facilities are stringently regulated.
- Drycleaners: Dry cleaning operations produce toxic air pollutants from the solvent used in the cleaning process such as petroleum and perchloroethylene. Petroleum solvents used in dry cleaning operations can release some toxic air pollutants and volatile organic compounds.
- Solid Waste Facilities/Landfill Sites: This type of site typically contains an inventory of solid waste disposal facilities or landfills in a particular state.
- State Hazardous Waste Sites (SHWS): SHWS records are the states' equivalent to federal record-keeping system, Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS). These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties.
- Brownfields Sites: A brownfield is a property, where the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant.
- Coal Ash sites: A listing of power plants that store ash in surface ponds.
- Voluntary Cleanup Sites are those participating in the voluntary cleanup program. Once SCDHEC staff and a non-responsible party have agreed upon an approved scope of work for a site investigation and/or

remediation, the party enters into a voluntary cleanup contract. Staff oversee the cleanup efforts to ensure that activities are performed to SCDHEC satisfaction. Upon completion of the negotiated work in the voluntary cleanup contract, the non-responsible party receives State Superfund liability protection.

- Contaminated Groundwater Remediation Sites: An inventory of all groundwater contamination cases in the state.

9.1 Impacts to Hazardous Materials

Hazardous materials records for Horry County were reviewed in February of 2023 and an Environmental Database Report (EDR) was generated (see **Appendix H: EDR Area/Corridor Report**). A spatial layer was created for this data with each site on a database represented by a single point. Based on the size of the SELL project, a Phase I ESA has not been conducted for each of the 16 alternatives. These sites are being identified during this preliminary phase to potentially avoid and minimize impacts. Field verification of hazardous sites in relation to the SELL project would be conducted during subsequent phases. **Table 8: Hazardous Materials Impacted by each Alternative** provides an overview of the hazardous material sites potentially encountered by each alternative.

Table 8: Hazardous Materials Impacted by each Alternative

Alternative	Number of Hazardous Materials Sites Impacted
1	11

11	12
12	8
13	8
14	97
15	127
16	199

In general, Alternatives 14, 15, and 16 are located in the urban and developed portions of Conway. The numerous businesses along corridors such as US 501 result in a higher number of hazardous material sites. Further study of hazardous materials within the SELL project will be necessary. Field verifications and current status of remediation should be verified and documented. Upon the narrowing of alternatives, the current status of the sites, proximity to the SELL corridor, and potential for the project to impact the site would be considered.

10 CULTURAL RESOURCES

The statewide cultural resources database, ArchSite, was queried (September 2020). The query extracted all records for cultural resources recorded within the SELL study area (see **Appendix I: Cultural Resources Memo**). Historic and cultural resources can include buildings, structures, objects, districts, archaeological sites, or features associated with people or past events in history. For this study, culturally sensitive resources were defined as all resources listed, eligible, or unevaluated for listing on the National Register of Historic Places (NRHP) and cemeteries.

The National Historic Preservation Act of 1966, as amended, created the NRHP and states that federally funded projects cannot arbitrarily destroy historic and cultural resources listed on the NRHP. Properties and sites listed on the NRHP may be above ground resources, such as buildings, classified as architectural, or below ground resources, such as prehistoric sites, classified as archeological. Section 106 of this Act requires federal projects, or those using federal funding, to assess the project's impacts on sites eligible for listing on the NRHP. Executive Order 11593 requires sites meeting the criteria for listing but that not listed on the NRHP, to be treated and afforded the same protections as those listed on the NRHP.

10.1 Impacts to Cultural Resources

The identified resources include historic districts, archaeological sites, structures, and cemeteries. A query identified 110 known, or previously documented, culturally sensitive resources within the SELL study area. This includes 32 resources that are listed on the NRHP and 73 resources that are eligible or unevaluated for listing. Of the 110 known resources, 30 cultural resources are impacted among the 16 alternatives evaluated. The number of resources impacted by each alternative are shown in **Table 9: Known Cultural Resource Impacts.**

Table 9: Known Cultural Resources Impacts

Alternative	NRHP listed or eligible sites	NRHP listed or eligible historic districts	Unevaluated Sites	Cemeteries	Total
1	1	--	--	--	1
2	1	--	--	--	1
3	--	--	--	--	0
4	1	--	--	--	1
5	--	--	--	--	0
6	1	--	--	--	1
7	--	--	--	--	0
8	2	--	--	--	2

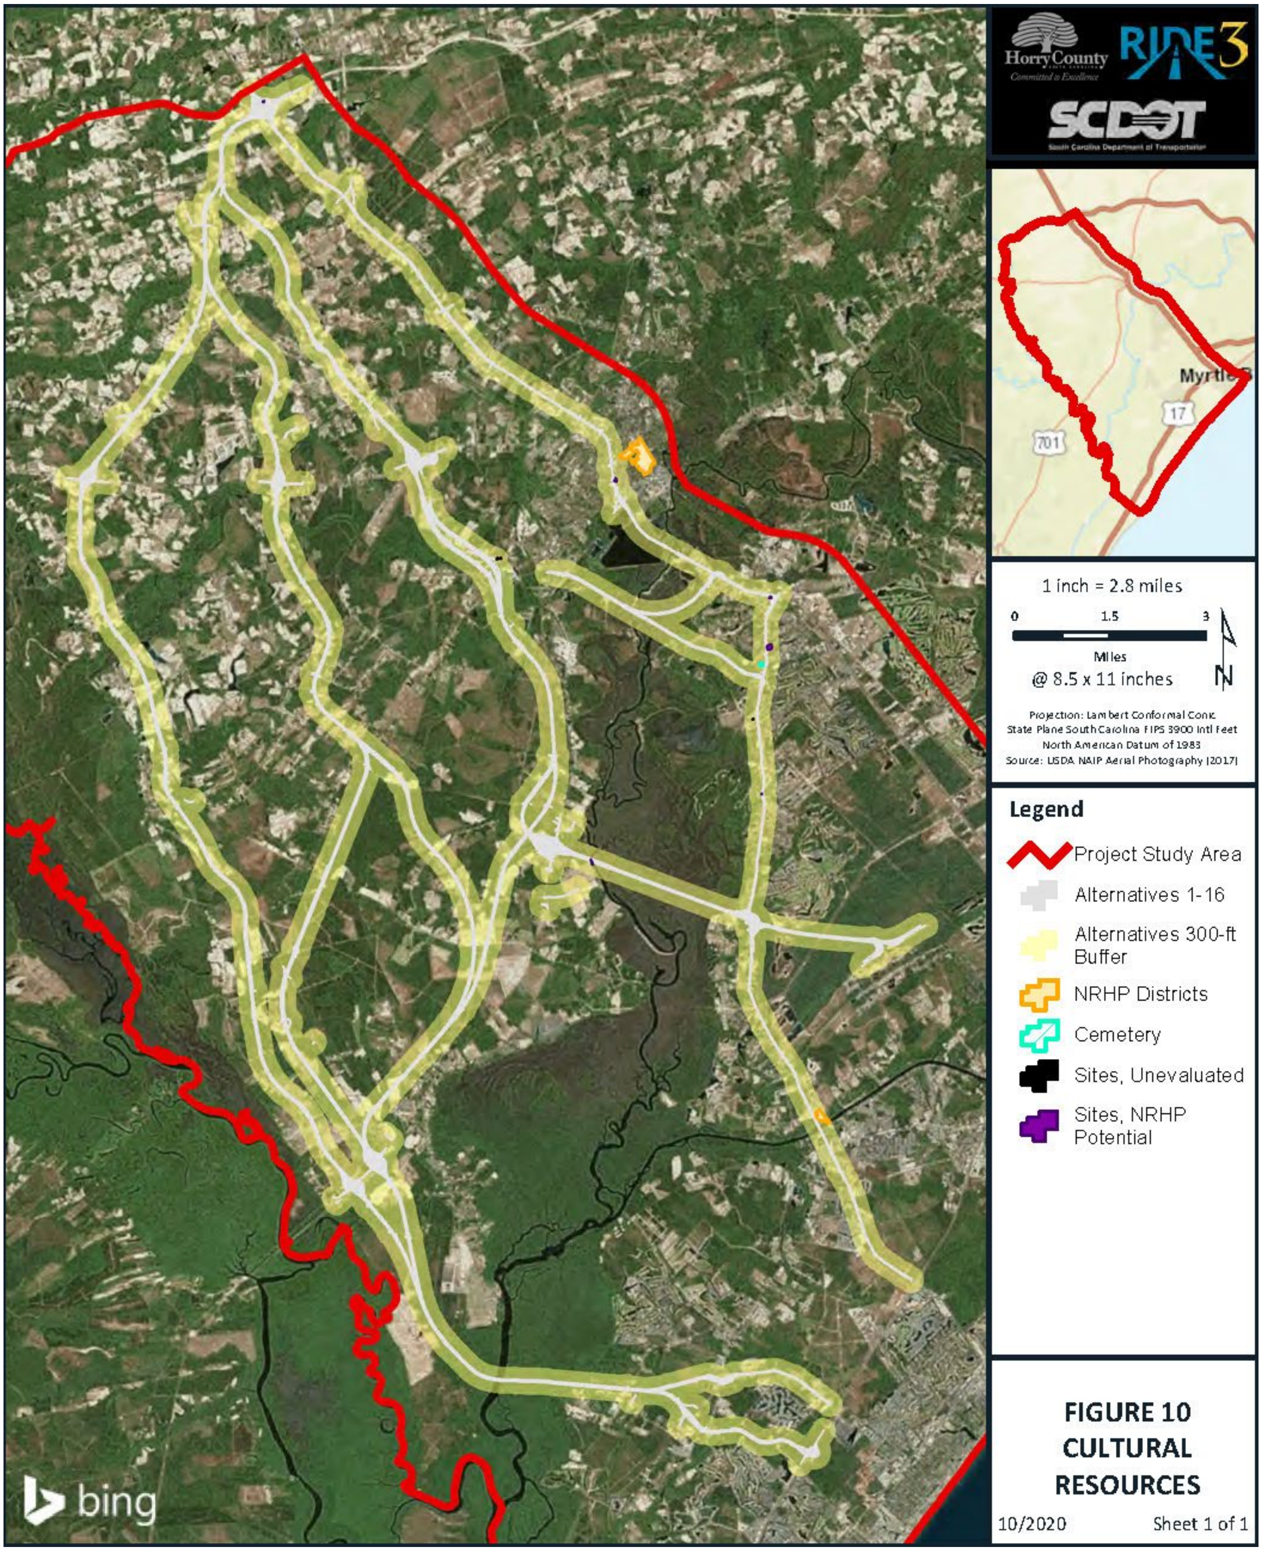
16	6	2	1	1	10

Figure 10: Potential Cultural Resource Impacts:



11 DISPLACEMENTS

Each of the alternatives would require the acquisition of property to complete the project. The acquisition of property for Right-of-Way must be in accordance with State Law 28-11-10 and the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (P.L. 91-646, as amended by 100-17; 49 CFR Part 24 Section 205). This Act was enacted by congress in 1971 to assist residents, organizations, and businesses displaced by public agencies in relocating without suffering a disproportionate loss. In addition to just compensation for the acquired property, equitable compensation normally associated with relocations is included as a part of the relocation assistance program. In response to the non-discrimination requirements in Title VI of the Civil Rights Act of 1964, the relocation advisory assistance shall be provided to all eligible persons without discrimination.

11.1 Displacement Impacts

Residential homes and commercial buildings located within the estimated right of way for the project are considered a potential relocation. Each of the remaining alternatives was evaluated utilizing survey-grade mapping and high-resolution aerial photography to determine the number of potential relocations that may be required under each alternative scenario. Potential relocations for each alternative are summarized in **Table 10**: **Relocations of each Alternative.**

Table 10: Relocations for each Alternative

Alternative	Number of Relocations
1	85
2	72
3	71
4	64
5	78
6	61
7	40
8	71
9	94
10	100
11	160
12	87
13	110
14	94
15	108
16	98

The total number of potential relocations ranges from a minimum of 40 to a maximum of 160 among alternatives. Specifically, Alternatives 11 and 13 would result in the greatest number of relocations. As it is the goal of Horry County to minimize impacts to its citizens, the total number of potential relocations will be considered when determining Reasonable Alternatives.

Potential relocations are based on conceptual alternative designs. As project design advances and final construction plans are completed, further measures to avoid and minimize impacts will occur, which may lower the number of total anticipated relocations.

12 AIR QUALITY

The National Ambient Air Quality Standards (NAAQS) were established by the U.S. Environmental Protection Agency (USEPA) under the Clean Air Act (CAA), as amended, to protect public health, the environment, and the quality of life from the detrimental effects of air pollution. The NAAQS have been set for the following six criteria pollutants: carbon monoxide (CO), lead (Pb), nitrogen dioxide (NO2), ozone (O3), particulate matter (PM), and sulfur dioxide (SO2). Mobile sources from on road vehicles contribute to four of the six criteria pollutants: CO, NO2, O3, and PM.

In accordance with the CAA, all portions of South Carolina are designated as in attainment, nonattainment, or unclassifiable for meeting NAAQS standards. An area with air quality that is better than NAAQS standards is considered to be in attainment, while an area with air quality that is worse than NAAQS standards is considered to be in nonattainment. If there is a lack of information for determining an attainment status, the area is designated as unclassifiable. Each state determines which areas within its boundaries are designated to be in attainment or nonattainment and must develop a State Implementation Plan (SIP) to ensure that areas achieve and/or maintain attainment status for NAAQS standards. The Clean Air Act Amendments (CAAA) of 1990 require that transportation plans, programs, and projects in nonattainment or maintenance areas that are funded or approved by FHWA, who are not currently involved at this time, be in conformity with the SIP. A review of air quality data determined that all counties in South Carolina are currently in attainment for the criteria pollutants. Therefore, conformity does not apply, and the proposed project would comply with the NAAQS.

In addition to the criteria air pollutants, USEPA also regulates air toxics. Most air toxics originate from human-made sources, including on-road mobile sources, nonroad mobile sources (i.e., airplanes), area sources (i.e., dry cleaners) and stationary sources (i.e., factories or refineries).

12.1 AIR QUALITY IMPACTS

Temporary air quality impacts could occur during project construction and would be in the form of emissions from construction equipment, dust from construction embankment, and clearing of areas prior to paving or revegetation. During construction, slowed traffic through construction areas may produce additional emissions. Emissions from construction equipment are anticipated to have a minimal impact on air quality due to the amount of time it would take to construct the proposed roadway improvements.

For each alternative, the amount of mobile source air toxics (MSAT) emitted will be proportional to the VMT, assuming that other variables such as fleet mix are the same for each alternative. Because the VMT estimated for the no-build alternative is higher than for any of the build alternatives higher levels of MSAT are not expected for any of the build alternatives compared to the no-build. The estimated VMT for the no-build would be higher than that of the build alternatives because the additional/new roadway would increase the efficiency of the other roadways and attract rerouted trips from elsewhere in the transportation network. In addition, because the estimated VMT under each of the alternatives are nearly the same, it is expected there would be no appreciable difference in overall MSAT emissions among the various alternatives. Also, regardless of the alternative chosen, new USEPA engine and fuel standards will cause overall MSAT emissions to decline over the next several decades. According to FHWA's Updated Interim Guidance on Mobile Source Air Toxic Analysis in NEPA Documents (January 2023), USEPA control programs are projected to reduce annual MSAT emissions by 76 percent from 2020 to 2060 even if VMTs increase.[7] Local conditions may differ from these national projections in terms of fleet mix and turnover, VMT growth rates, and local control measures. However, the magnitude of the USEPA-projected reductions is so great (even after accounting for VMT growth) that MSAT emissions in the PSA are likely to be lower in the future in virtually all locations/along all alternative alignments.

Under each alternative there may be localized areas where VMT would increase and other areas where VMT would decrease. Therefore, it is possible that localized increases and decreases in MSAT emissions may occur. The localized increases in MSAT emissions would likely be most pronounced along the segments of new roadway alignment that would be built adjacent to development/developed areas, most notably under Alternatives 12, 13, 14, 15, and 16. However, even if these increases do occur, they too will be substantially reduced in the future due to implementation of USEPA's vehicle and fuel regulations. In sum, under all build alternatives in the design year it is expected there would be reduced MSAT emissions in the immediate area of the project, relative to the no-build alternative, due to the reduced VMT associated with more direct routing, and due to USEPA's MSAT reduction programs.

This project has been determined to generate minimal air quality impacts for CAA criteria pollutants and has not been linked with any special MSAT concerns. As such, this project would not result in changes in traffic volumes, vehicle mix, basic project location, or any other factor that would cause an increase in MSAT impacts of the potential build alternatives from that of the no-build alternative.

13 LAND USE

The SELL PSA is primarily within Horry County, with a small portion in Georgetown County. None of the alternatives cross Georgetown County and this land use discussion primarily focuses on Horry County. The PSA can also be described by areas generally from east to west to identify land uses more regionally: Burgess, Socastee, Bucksport, Bucksville, Waccamaw National Wildlife Refuge (WNWR), and Conway. Myrtle Beach, Surfside Beach, and Murrells Inlet also fall within the eastern edge of the SELL PSA, but are outside the alternative corridors.

[7] FHWA (2023, January 18). Memorandum: Updated Interim Guidance on Mobile Source Air Toxic Analysis in NEPA Documents. Retrieved January 30, 2023, from https://www.fhwa.dot.gov/environment/air_quality/air_toxics/policy_and_guidance/msat/index.cfm

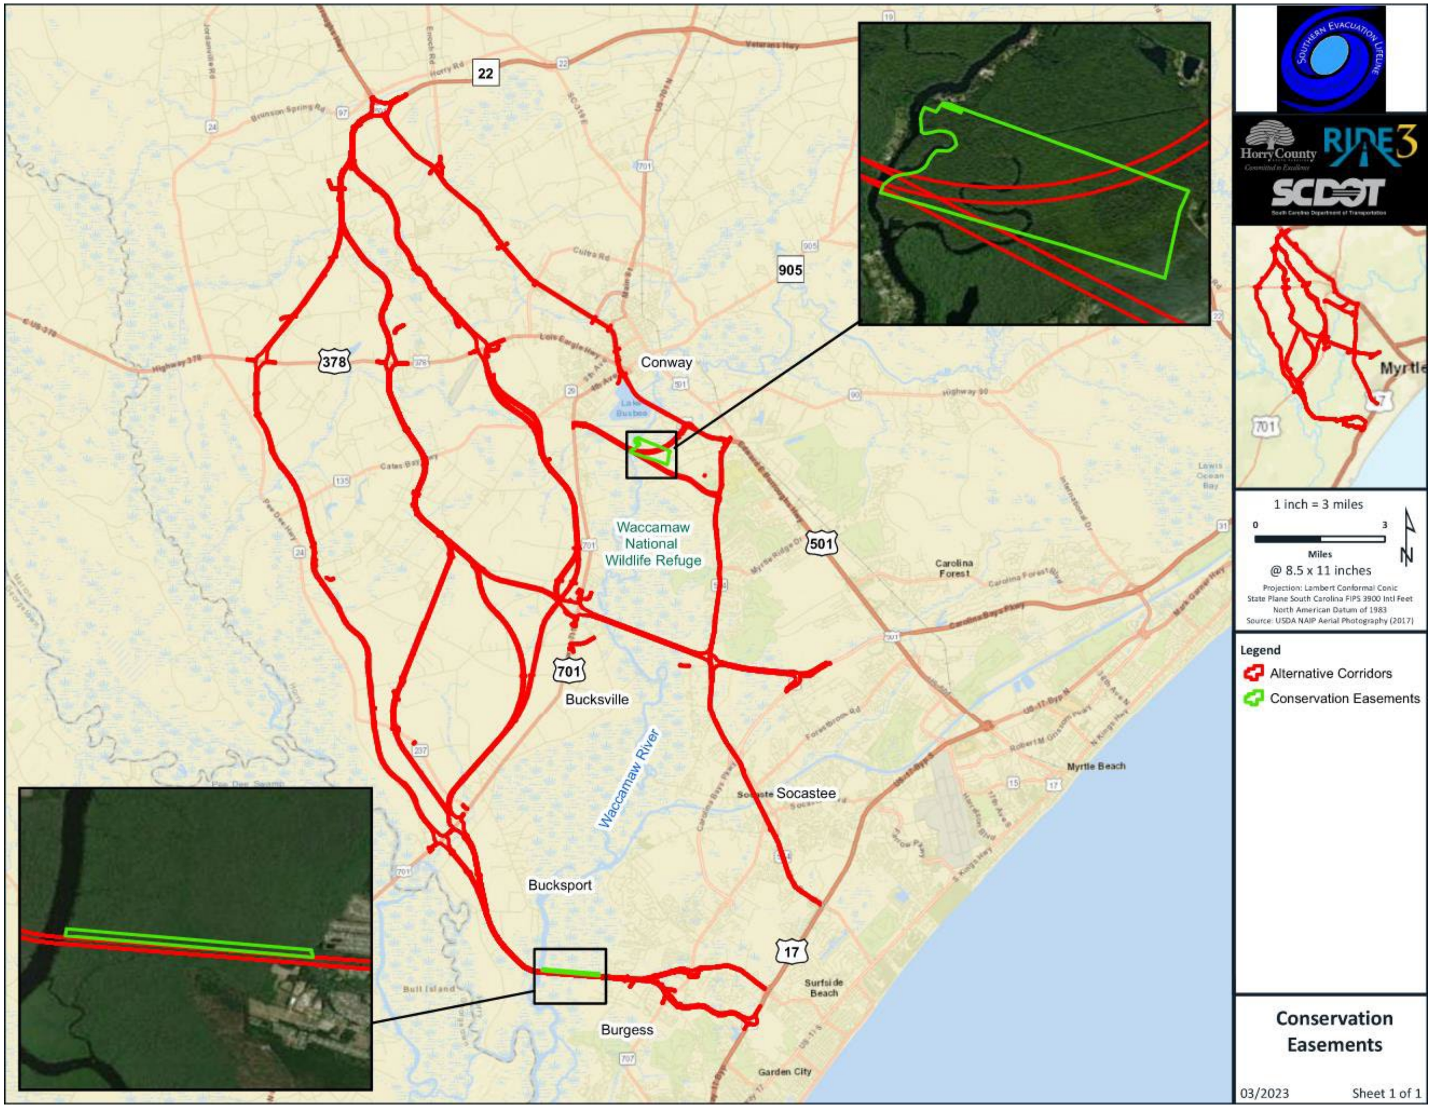
The Horry County IMAGINE 2040 Comprehensive Plan (IMAGINE 2040 Plan) was adopted in 2019.[8] This plan was created by studying the existing conditions of the community to identify practical implementation strategies to help the County reach its preferred future goals. The IMAGINE 2040 Plan addresses land development decisions, capital projects, and many other governmental decisions that might impact the future health of the County.

Various local plans were also adopted as amendments to the IMAGINE 2040 Plan, including but not limited to two neighborhood plans; the Bennett Loop Neighborhood Revitalization Plan (2015, Burgess Community Area Plan (2012) and the Racepath Neighborhood Revitalization Plan (2014). Neighborhood plans were implemented with the intent to stabilize and improve the conditions of low-to-moderate income deteriorating communities in the hopes of providing improved quality of life for its residents. Another plan that was adopted was a farmland preservation plan, the Highway 319 Rural Heritage Area Plan (2011), that was created to protect the rural and agricultural heritage of the corridor between Conway and Aynor.

According to the IMAGINE 2040 Plan, current land uses within the SELL PSA in Horry County include municipal, rural (agricultural and forestland), vacant land, residential (single-family, multifamily), business/commercial, industrial and utility, transient lodging, golf course, public and institutional, conservation preservation, and roadway right-of-way. Most of the county land is vacant, specifically away from the coast, followed by agricultural and forestland. Regionally in the PSA, existing land use is primarily rural (agricultural/forestland) around Burgess, single-family residential around Socastee, industrial and vacant land around Bucksport, rural (agricultural/forestland) around Bucksville, conservation/preservation around the WNWR, and municipal and golf course around Conway. In addition, there are two conservation easements/parcels within the WNWR /along the Waccamaw River that were purchased by nonprofit conservation organizations. One easement/parcel is near Bucksport, and one is near Conway south of Lake Busbee. These areas are shown in **Figure 11: Conservation Easements**.

[8] Horry County (2019, December 10). Horry County IMAGINE 2040 Comprehensive Plan. Retrieved January 12, 2023, from https://www.horrycountysc.gov/media/54ymmrnu/adopted-imagine-2040-with-12-08-2020-amendment-compressed.pdf

Figure 11: Conservation Easements



The existing land use pattern in the county is influenced by development that preceded zoning and land development regulations. According to Horry County's IMAGINE 2040 plan, the county is in a growth and development phase and is undergoing rapid development. New development consumed more than 53 square miles of land in Horry County from 1996 to 2010, primarily for new subdivisions. Thereby, some future land uses within the county and specifically the PSA include commercial corridors, neighborhood activity center, scenic and conservation, economic activity center, rural, municipality, suburban, rural activity center, rural communities, and community activity centers and follow the development trend. Regionally, Burgess includes "suburban use" and a small strip of "scenic and conservation land." Socastee future land use is mostly "suburban," "neighborhood activity center," and "commercial corridor" with some "scenic and conservation" along the river. Bucksville is mostly "rural," and the remaining area is "scenic and conservation." Bucksport includes rural communities and "economic activity center" along the main corridor, Bucksport Road, and "scenic and conservation" in the remaining surrounding area. The WNWR area is predominantly "scenic and conservation," and a few areas are "municipality." Conway future land use is almost entirely "commercial corridor," "municipality," and "suburban" with scattered "scenic and conservation."

More specifically, future land use for the alternatives is shown in **Table 11: Future Land Use type by Alternative** and can be seen in **Figure 12: Future Land Use**.

Figure 12: Future Land Use

16	Commercial Corridor, Community Activity Center Core, Community Activity Center - Outer Ring, Municipality, Neighborhood Activity Center, Rural, Rural Communities, Scenic & Conservation, Suburban

In total, Horry County operates 28 parks, 29 boat landings, 22 beach accesses, 3 regional parks, 3 recreation centers, and 2 community centers. These facilities include 39 baseball/softball fields, multipurpose fields, tennis courts, outdoor basketball courts, 26 playgrounds, 2 disc-golf courses, and 13.5 miles of trails on nearly 600 acres of land. The County also has two paddling trail which cross the SELL PSA, the Waccamaw River Blue Trail, and the Southeast Coast Saltwater Paddling Trail. A complete list of Horry County recreational facilities can be found in the Horry County Parks and Recreation online inventory.[9]

[9] Horry County (2023). Parks & Recreation. Retrieved February 16, 2023, from https://www.horrycountysc.gov/departments/parksandrecreation/parks/

Two community/recreational centers are in proximity to the alternative corridors: Burgess Community Center is on SC 707 neighboring Burgess Park, adjacent to Alternatives 2, 4, 6, 12, and 13, and the Conway Sports and Fitness Center, which also houses the Conway Senior Center on Mill Pond Road is adjacent to Alternative 16. The alternative corridors cross one Horry County public park: Swing Bridge Park (Socastee Landing and Park) within Alternative 16. Sandridge Park is in proximity to Alternatives 9, 11, and 13. City of Conway parks/recreational areas in the PSA include the Conway Dog Park, and the Lake Busbee Walking Trail within the Alternative 16 corridor. Pee Dee Park is also adjacent to Alternatives 3 through 7 in Conway.

As previously noted, no alternatives cross Georgetown County; however, the overall SELL PSA includes a small portion within Georgetown County. The Georgetown County Comprehensive Plan was adopted by County Council in 2015 and the County is currently updating the plan.[10] According to the plan, Georgetown County has been divided into two planning areas: Waccamaw Planning Area (excluding Pawleys Island) and the remainder of Georgetown County (excluding the City of Georgetown and Town of Andrews). The SELL PSA falls within the Waccamaw Planning Area, which has the greatest amount of developed land compared to the other planning area. Existing land use in the Waccamaw Planning Area is predominantly recreational and residential (low density, mobile homes, high density, and multifamily/medium density) followed by commercial. Most of the current land within the entire SELL PSA is recreational, residential, and vacant. The amount of commercial, residential, and recreational land use has increased in the last 15 years. Like Horry County, Georgetown County has experienced an increase in development due to its proximity to the coast, waterways, and its location between Charleston and Myrtle Beach, and development is expected to continue to increase within the next 20 years. Following that trend, future land use in the Waccamaw Planning Area is predominantly residential followed by commercial, industrial, and utility. Therefore, the current and future land use of the county has influenced/affected the siting of the alternatives outside county boundaries.

13.1 Land Use Impacts

The proposed project would provide the region with congestion relief, improved hurricane evacuation, and improved access to needed services east and west of the Waccamaw River. Therefore, land uses should benefit from the proposed project through improved traffic conditions and mobility.

The proposed alternatives have the potential to directly impact three public parks/recreational areas: Swing Bridge Park (Socastee Landing and Park) on Corporal Dennis Lyden Memorial Highway), and Conway Dog Park and the Lake Busbee Walking Trail on New Road. The conceptual design for Alternative 16 would cross the Conway Dog Park near Church Street and New Road. The other two parks would be avoided by conceptual design, but the park boundaries fall within the alternative corridors, and could be affected by the project design. Alternatives 14 and 15 cross a conservation easement near Conway within the WNWR (where the alternatives combine). An

[10] Georgetown County. (2015). Land Use Element Georgetown County Comprehensive Plan. Retrieved January 12, 2023, from https://www.gtcounty.org/DocumentCenter/View/158/Land-Use-Element-with-Maps-PDF

easement farther south, near Bucksport, is very close to several alternatives, however the boundaries do not overlap. Both easements should be avoided (**Figure 11**: **Conservation Easements**).

Indirect land use impacts are generally associated with induced growth and impacts from changes in the existing land use patterns, population density, or growth rate of an area. Transportation projects often reduce travel time, enhancing the attractiveness of surrounding land for developers and influencing local development trends. Subsequently, these land use changes could lead to environmental impacts such as degradation of natural habitat and/or water quality issues.

The proposed alternatives have the potential to indirectly impact the existing land use by supporting and expediting development in the surrounding areas. In addition, the improved roadway network could make the surrounding areas more desirable, increasing residential and commercial opportunities. However, the project is not expected to alter the current zoning or planned future land uses, and therefore, would result in minimal indirect impacts to land use.

Cumulative impacts would occur when impacts resulting from the project are added to historical changes in land use as well as reasonably foreseeable future actions. The historical development of the PSA has altered the surrounding landscape resulting in the urbanization of the surrounding area. The development of the area is expected to continue as documented by the planned growth and development. However, the proposed improvements are consistent with the planned growth for the area based on county land use plans. Looking towards the foreseeable future, the surrounding areas have the greatest potential for impact through continued commercial/industrial development and associated infrastructure needs, specifically in Socastee, Burgess, and Conway. As such, the proposed improvements are consistent with local zoning and the planned land uses for the surrounding areas.

13.2 Waccamaw National Wildlife Refuge

National Wildlife Refuge lands were identified and the WNWR was noted to be inside the PSA. The WNWR is approximately 24,196 acres of protected land and any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge before any proposed activity can occur within the Refuge.

The WNWR was established to protect and manage diverse habitat components within an important coastal river ecosystem. Protection and management benefit threatened and endangered species, freshwater and anadromous fish, migratory birds, and forest wildlife, including a wide array of plants and animals associated with bottomland hardwood forests. Compatible wildlife-dependent recreational activities, including hunting, fishing, wildlife observation and photography, environmental education, and interpretation for present and future generations also benefit from proper management and protection.

The draft Comprehensive Conservation Plan (CCP) for the Waccamaw National Wildlife Refuge (February 2008) was prepared to provide a clear direction for management of the refuge consistent with the mandates of the National Wildlife Refuge System. The CCP will provide refuge neighbors, visitors, and government officials an understanding of management action on and around the refuge. The CCP states that the addition of new rights of way, such as is proposed for the SELL project, will have to be addressed on a case-by-case basis. When new construction is proposed, the plan states that the refuge will work with the responsible agency for the right of way to avoid and minimize potential impacts to resources such as habitat fragmentation, wetland hydrology and function, and migration of wildlife.

Since the CCP was drafted, the size of the refuge has grown. Its 54,000-acre acquisition boundary contains portions of the Great and Little Pee Dee Rivers and the Waccamaw River. Sections of the Great Pee Dee River as well as the Little Pee Dee River are designated Type 1 Natural State Scenic Rivers. The refuge was established not only to protect habitat for wildlife but also to provide recreational activities, including hunting and fishing.

These river systems and associated wetlands comprise a large portion of the Winyah Bay drainage basin which stands out as one of the most extensive, intact wetland complexes in the Southeast. Waccamaw's tidal freshwater wetlands are some of the most diverse freshwater wetland systems found in North America today and include managed wetlands, abandoned and unmanaged tidal rice fields, creeks, and flats. They not only provide important habitats corridors for wildlife, but they also play a critical role in the filtration and storm water retention for the primary drinking water resource of the greater Grand Strand region.[11]

More than 400 species of animals are supported by a variety of habitats within the refuge, including birds such as the swallow-tailed kite, osprey, wood stork, white ibis, and prothonotary warbler. Forested wetlands within the WNWR provide critical nesting habitat for swallow-tailed kites as well as habitat for wood ducks and hooded mergansers. Additionally, the WNWR is critical to protecting contiguous habitat for the black bear.[12]

14 PUBLIC PARKS/USE AREAS AND SECTION 6(F)

The Land and Water Conservation Fund Act (LWCFA) of 1965, as amended, allows state and local governments to obtain grants for acquiring or improving parks and recreation areas. Section 6(f)(3) of this Act prohibits the conversion of property acquired or developed with these grants to a non-recreational purpose without the approval of the Department of the Interior's National Park Service (NPS). In South Carolina, the Department of Parks, Recreation, and Tourism (SCPRT) administers the LWCFA program.

14.1 Public Parks in the Study Area and Section 6(f) Resources

Within the SELL PSA, Horry County has 1 regional park, 2 recreation centers, 8 neighborhood parks, 15 boat landings, and 2 future parks. Additionally, acreage is protected for recreation and public and private conservation. The City of Conway has seven park facilities, and the SCDNR owns and operates the Waccamaw River Heritage Preserve/Wildlife Management Area within the PSA. Because SELL is funded through Horry County's RIDE III transportation improvement program, and not through the FHWA, none of the parks and recreation areas owned by the State of South Carolina, Horry County, the City of Conway, or otherwise are protected by Section 4(f) of the U.S. Department of Transportation Act.

[11] https://www.fws.gov/refuge/waccamaw

[12] https://www.sccoastalfriends.org/service-area/waccamaw-national-wildlife-refuge/

14.2 Impacts to Public Parks/Use Areas

There are six alternatives that would directly impact a park or recreational facility – Alternatives 7, 8, 9, 14, 15, and 16 (**Table 12: Impacts to Public Recreational Facilities**).

Table 12: Impacts to Public Recreational Facilities

Alternative	Owner	TMS	Total Parcel (acres)	Impact (acres)
7	SC Department of Natural Resources	1610002159	2,159	58.33
8	SC Department of Natural Resources	1610002159	2,159	58.33
9	SC Department of Natural Resources	1610002159	2,159	58.33
14	Hillcrest Cemetery	1500006042	84.68	20.40
14	Singleton Cemetery	1610002147	0.79	0.53
15	Hillcrest Cemetery	1500006042	84.68	20.40

16	Hillcrest Cemetery	1500006042	84.68	20.40
16	Singleton Cemetery	1610002147	0.79	0.53
16	Bridge Tender Owners Assoc. Inc	77007020028	7.76	1.50
16	City of Conway	137700030001	5.8	1.41

Seventy-five parks and wildlife refuge resources funded through the Land and Water Conservation Fund (LWCF) were identified in the PSA, all of which are considered 6(f) resources.

The WNWR spans portions of Horry, Georgetown, and Marion Counties and comprises close to 55,000 acres, including sections of the Waccamaw and Great Pee Dee Rivers. The portion of the Waccamaw River that runs through the refuge is a designated National Water Trail. Investments in the Refuge from the Land and Water Conservation Fund total more than $16 million. Based on the funding provided by the LWCF, the park is protected under Section 6(f).

14.3 Section 6(f) Impacts

There are four alternatives that would impact the WNWR – Alternatives 7, 8, 9, and 14 (**Figure 13: Alternatives that Impact the Waccamaw National Wildlife Refuge**). Alternatives 7 through 9 all cross the river within the same corridor footprint; therefore, they will each result in an impact of approximately 58.33 acres of the WNWR. Alternative 14 would impact approximately 20.02 acres of the WNWR near the corridor crossing at West Cox Ferry Road.

Figure 13: Alternatives that Impact the Waccamaw National Wildlife Refuge

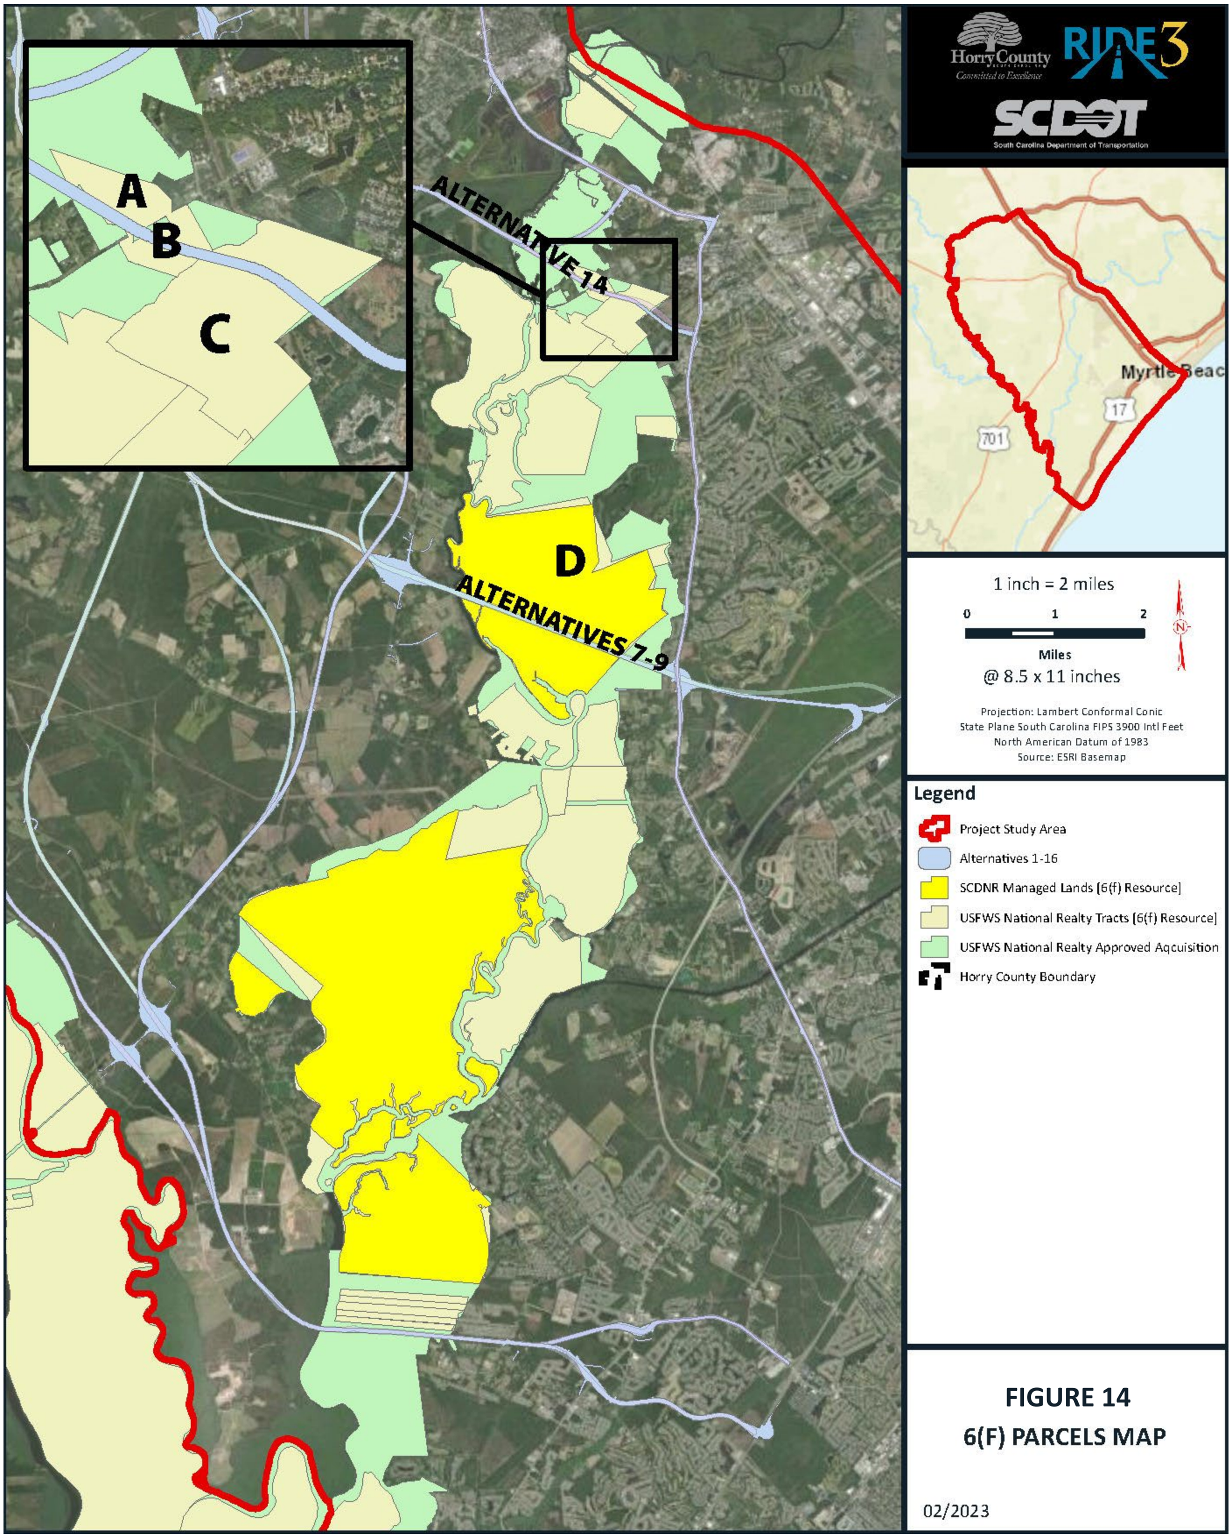

Table 13: Estimated 6(f) Impacts outlines estimated impacts from the conceptual alternatives.

Table 13: Estimated 6(f) Impacts

14.4 6(f) Consultation

Consultation for park conversion would be required between the property owners, the SCPRT, the NPS, for any impacts of 6(f) resources. Conversion of a 6(f) property must go through the process outlined in 36 CFR Part 59, Section 6(f)(3), prior to being approved by the NPS.

Requirements of the 6(f) conversion include:

a. All practical alternatives to avoid impacts to the resource have been evaluated and rejected on a sound basis.

b. The fair market value of the property to be converted has been established and the property proposed for substitution is of at least equal fair market value as established by a state approved appraisal excluding the value of structures or facilities that will not directly enhance its outdoor recreation utility.

c. The property proposed for replacement is of reasonably equivalent usefulness and location as that being converted. Equivalent usefulness and location will be determined based on the following criteria:

   (1) Property to be converted must be evaluated to determine what recreation needs are being fulfilled by the facilities which exist and the types of outdoor recreation resources and opportunities available. The property being proposed for substitution must then be evaluated in a similar manner to determine if it will meet recreation needs that are at least like in magnitude and impact to the user community as the converted site.

(2) Replacement property need not necessarily be directly adjacent to or close by the converted site. This policy provides the administrative flexibility to determine location recognizing that the property should meet existing public outdoor recreation needs.

(3) Should a local project sponsor be unable to replace converted property, the State would be responsible, as the primary recipient of federal assistance, for assuring compliance with these requirements and for the substitution of replacement property.

(4) The acquisition of one parcel of land may be used in satisfaction of several approved conversions and vice versa.

d. The property proposed for replacement meets the eligibility requirements for LWCF assisted acquisition. The replacement property must constitute or be part of a viable recreation area.

15 SOCIAL AND ECONOMIC

The social and economic resources of the SELL PSA were evaluated with available Community Impact Data (**Appendix K**) to identify the social and economic resources, including existing demographics in and around the SELL PSA. The alternatives were analyzed for their potential social impacts in terms of residential and nonresidential/business relocations, alteration of transportation patterns, disruption of planned or established communities, disruption of development, and changes in employment. The proposed project would require the acquisition of right-of-way, including commercial and residential parcels, resulting in direct displacements.

15.1 Social and Economic Impacts

The project has the potential to directly impact three publicly owned recreational areas/parks: Swing Bridge Park (Socastee Landing and Park) on Corporal Dennis Lyden Memorial Highway, and Conway Dog Park and the Lake Busbee Walking Trail on New Road in Conway. The conceptual design for Alternative 16 would cross a portion of the Conway Dog Park near Church Street and New Road resulting in potential impacts. The other two parks would be avoided by conceptual design, but the park boundaries fall within the alternative corridors, and could be affected by the project design. Pee Dee Park is also adjacent to Alternatives 3 through 7 in Conway. Impacts to public parks are discussed in detail in Section 14 within this study.

The project alternatives would impact two churches as well as over 100 businesses, numerous residences, and communities/residences. Alternatives 8, 10, and 12 would potentially relocate Bethlehem Missionary Baptist Church on Dirty Branch Road, and Alternatives 14, 15, and 16 would potentially relocate Trinity Freewill Baptist Church on U.S. 501 in Conway. Business/nonresidential impacts include gas stations, a pool house and pool associated with a neighborhood, an outbuilding, and various commercial/retail businesses. In addition, Alternatives 15 and 16 currently impact part of the bleachers of the Coastal Carolina University stadium. **Table 14: Direct Impacts to Community Resources by Alternative** notes the number of impacts/displacements to community resources (churches and businesses) for each alternative. No fire departments or community centers would be directly affected by the alternatives. Residential impacts are discussed and illustrated in the Environmental Justice (EJ) section (Section 16) of this study.

Table 14: Direct Impacts to Community Resources By Alternative

Alternative	Business Impact	Church Impact
1	3	0
2	1	0
3	3	0
4	1	0
5	3	0
6	1	0
7	1	0
8	3	1
9	2	0
10	3	1
11	4	0
12	3	1
13	2	0
14	24	1
15	27	1
16	58	1

As indicated in Table 14, Alternative 16 would impact the greatest number of businesses due to crossing through Conway. Alternatives 2, 4, 6, and 7 would impact the fewest (1). Alternatives 8, 10, 12, and 14 through 16 would each impact one church.

Community cohesion is the social connections within a community. Transportation projects can affect community cohesion by fragmenting neighborhoods, isolating a portion of neighborhood, or displacing a community gathering place like a church or community center with the placement or widening of a road. New roadways can also generate new development or affect property values. The proposed project would affect community cohesion by bisecting neighborhoods, relocating a substantial number of residents, and by displacing churches that serve the communities. The project alternatives would affect community cohesion, including bisecting 9 neighborhoods and displacing 2 churches that are near several EJ areas. All alternatives, except Alternative 16, would fragment communities. Alternatives 9, 11, and 13 would impact the most communities (four each). Of the communities fragmented by the alternatives, at least four are EJ (Pine Crest, Cabots Creek, an unnamed mobile home park, and an unnamed community). Cherry Knoll and an unnamed mobile home community would be fragmented by six alternatives. The Farm at Timberlake and The Lakes would be fragmented by five alternatives. Woodland Lakes and Cabots Creek would be fragmented by three alternatives, and Sedgefield and Pine Crest would be fragmented by two alternatives. Therefore, all alternatives, except Alternative 16 would affect community cohesion.

The social impacts are the direct relocation and displacement of residential properties, nonresidential properties, and businesses due to the proposed new road and changes in or elimination of access and fragmenting of communities associated with the new roadway. The new roadway, regardless of which alternative is chosen, would create minor travel pattern changes around intersections, specifically along the major roads in the areas: US 17, US 501, US 701, and SC 544. However, the proposed project would ultimately provide congestion relief and improve mobility along other roads in the PSA by providing a more direct route to the west for hurricane evacuations. The proposed project would improve the ease with which motorists can reach their destinations along the project corridor and in the vicinity. As such, the project is anticipated to an overall provide direct beneficial social impacts for commuters. While making no transportation improvements (no-build alternative) would not cause direct impacts to social resources, congestion in the area would not be relieved nor would hurricane evacuation and access to needed services be improved. Please refer to the Community Impact Data (**Appendix K**) for additional detail on community, social, and economic impacts.

16 ENVIRONMENTAL JUSTICE

U.S. Census Bureau data was evaluated to determine the demographics of the PSA compared to the county and state. Census data indicates that the area within and surrounding the PSA primarily has a median income lower than the county average of $51,570, percentage in poverty higher than the county (14.1 percent), and a minority percentage higher than the county (22.7 percent). Specifically, 18 block groups have populations with low-income and/or minority populations that would qualify as environmental justice (EJ) populations. The populations in the PSA are predominantly White (Non-Hispanic), African American, and Hispanic/Latino.[13] Census data tables showing the demographics of the state, county, census tracts, and block groups can be found in the Community Impact Data (**Appendix K: Community Impact Data**).

The USEPA's Environmental Justice Screening and Mapping (EJScreen) tool (Version 2.1) was also utilized to determine demographics and environmental information for the entire SELL PSA.[14] According to EJScreen, the PSA contains a lower percentage of people of color (29 percent) compared to the state (36 percent), a higher percentage of low-income populations (41 percent) than the state (36 percent), a higher unemployment rate (7 percent) than the state (6 percent), and a higher percentage of linguistically isolated populations (2 percent) than the state (1 percent). However, pollutants affect a lower number of populations in the PSA compared to the state, specifically particulate matter, Ozone, hazardous waste proximity, and lead paint. The EJScreen summary can be found in **Appendix K**.

According to USDOT and FHWA, "low-income" populations are individuals whose household incomes are at or below the U.S. Department of Health and Human Services poverty guidelines, as defined by the U.S. Census

[13] U.S. Census Bureau (2020). *American Community Survey DP05ACS DEMOGRAPHIC AND HOUSING ESTIMATES*. Retrieved August 3, 2022, from https://data.census.gov/cedsci/table?q=DP05&g=0400000US45_0500000US45051&tid=ACSDP5Y2020.DP05

[14] EPA (2023). *EPA's Environmental Justice Screening and Mapping Tool (Version 2.1).* EJScreen. Retrieved August 3, 2022, from https://ejscreen.epa.gov/mapper/

Bureau. Low-income populations that meet the criteria for EJ are defined as those in which either the number of individuals living in poverty in a single block group (or the affected area) comprise 25 percent or more of the total population of that affected area, or the total percentage of individuals living in poverty within the affected area (or single block group) is at least 5 percentage points greater than the percentage of individuals living in poverty in the whole county.

According to USDOT and FHWA, minorities constitute five races/ethnicities, including African American, Hispanic, Asian-American, American Indian, and Alaskan Native populations. Minority populations that meet the criteria for EJ are defined as either when the minority population of the affected area (single block group) exceeds 50 percent of the total block group population, or is 10 or more percentage points greater than the minority population percentage in the whole county.

The PSA includes a high percentage of minorities and/or low-income populations, which qualify as EJ populations. Minority and low-income percentages are based on block group data from the U.S. Census Bureau's 2020 American Community Survey 5-Year Estimates.

16.1 Impacts to EJ Populations

FHWA and USDOT orders define "adverse effects" on EJ populations as "the totality of significant individual or cumulative human health or environmental effects, including interrelated social and economic effects…" Beneficial and adverse effects to EJ populations were evaluated for the project alternatives. Each alternative was evaluated for the presence of minority and low-income (EJ) populations/communities and subsequent EJ impacts. EJ areas are described and shown in the Community Impact Data in Appendix K.

Table 15: Potential EJ Impacts by Alternative indicates the number of potential EJ residences or areas along each alternative based on the above methodology as well as the total number of project relocations, number of potential EJ impacts, and the associated community. As noted in the table, potential EJ residences are present along each alternative. Alternative 15 has the highest number of EJ areas/residences (83) and Alternative 7 has the fewest (35). EJ impacts were quantified and compared across alternatives based on the number of potential impacts. Alternatives with a high number of EJ impacts compared to the total number of EJ properties (approximately half of the total number of EJ properties) and total potential project relocations are noted in orange in Table 15: Potential EJ Impacts by Alternative.

Table 15: Potential EJ Impacts By Alternative*

Alternative	Number of Potential EJ Properties	Number of Potential Direct EJ Impacts	EJ Communities Affected
1	72	25	Unnamed Mobile Home Park (MHP)
2	57	28	Unnamed MHP
3	54	15	Fern Ridge MHP, Juniper Bay Estates MHP
4	39	18	Fern Ridge MHP
5	58	16	Juniper Bay Estates MHP, unnamed MHP
6	42	19	Juniper Bay Estates MHP
7	35	16	Fern Ridge MHP, Juniper Bay Estates MHP, Cabots Creek
8	61	37	Cabots Creek, unnamed community, Iowa Alston Estates, unnamed MHP, plus Bethlehem Missionary Baptist Church relocation
9	54	26	Cabots Creek, unnamed MHP
10	82	37	Iowa Alston Estates, unnamed MHP, unnamed community, plus Bethlehem Missionary Baptist Church relocation
11	75	27	Unnamed MHP
12	66	45	Iowa Alston Estates, unnamed community, plus Bethlehem Missionary Baptist Church relocation
13	59	34	Unnamed MHP
14	71	55	Pine Crest, unnamed MHP, Browns MHP, plus Trinity Freewill Baptist Church
15	83	63	Pine Crest, unnamed MHP, Browns MHP, Covered Oaks, plus Trinity Freewill Baptist Church
16	80	30	Woodwinds, Browns MHP, Crossroads Village, Covered Oaks, plus Trinity Freewill Baptist Church relocation

*Note: This is a conceptual level analysis and additional outreach and study would be needed as the project progresses.

As indicated in the table, Alternatives 12, 14, and 15 would result in the highest number of direct EJ impacts, primarily due to the corridors fragmenting or impacting a large number of residents in several neighborhoods in the Conway area, specifically Iowa Alston Estates, Pine Crest, and various unnamed mobile home parks. Alternatives 8 and 9 would result in fragmentation of the EJ community Cabots Creek. In addition, Alternatives 8, 10, and 12 would relocate Bethlehem Missionary Baptist Church and Alternatives 14, 15, and 16 would relocate Trinity Freewill Baptist Church, resulting in adverse impacts to community cohesion.

The 16 alternatives would impact low income and/or minority populations in the PSA due to relocation and community cohesion impacts. Based on preliminary analysis, Alternative 15 would result in the greatest number of EJ impacts (63) and Alternative 3 would result in the fewest (15), followed by Alternative 5 and 7 (16).

Based on preliminary analysis, EJ displacements would potentially account for a majority of the displacements/impacts for seven of the project alternatives. Therefore, those alternatives have the potential to displace a disproportionately high number of EJ residences/populations. In addition, the potential relocation of two churches that serve EJ areas would result in adverse impacts to community cohesion. Therefore, there are potentially disproportionately high and adverse effects on low income and/or minority EJ populations as a result of the project. This conceptual analysis of EJ impacts primarily focuses on relocation impacts, however additional study and assessment is needed to determine all potential EJ impacts.

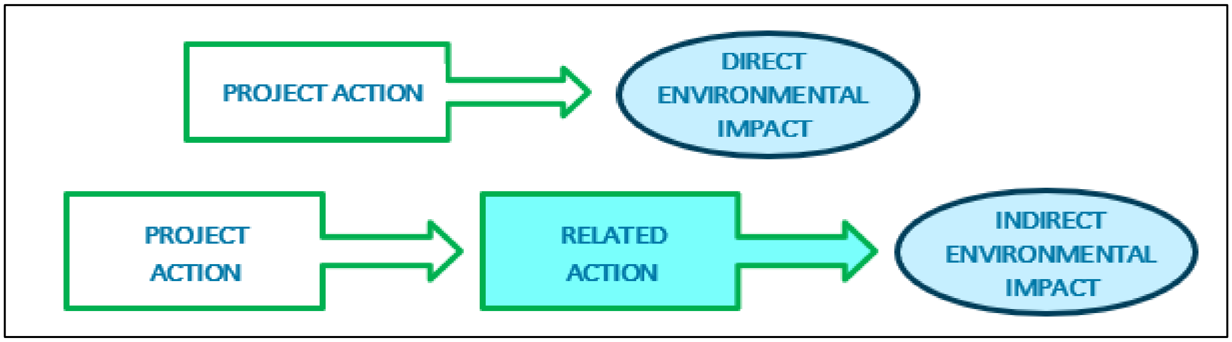
17 INDIRECT AND CUMULATIVE IMPACTS

The proposed SELL project has the potential to impact environmental, cultural, and human resources within the PSA. A range of conceptual alternatives are being considered that accomplish the purpose and need of the project. Each alternative would impact known resources to a varying degree and each alternative provides benefits. In developing the proposed project, impacts to the human and natural environment would be minimized to protect cultural resources, community values, and natural resources. This would be accomplished by attempting to avoid high value resources and sensitive areas where possible and minimizing impacts when avoidance is not possible. Types of impacts are discussed below:

Direct impacts are defined as impacts which are caused by the action and occur at the same time and place. Examples of direct impacts include loss of acreage, reduction in natural resources such as forests, loss of historic structures or archeological resources.

Indirect impacts are defined as those impacts which are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. **Figure 14: Flow Chart of Indirect Impacts**[15], illustrates the relationship between a project action and the indirect, but related, impacts that may reasonably follow.

Figure 14: Flow Chart of Indirect Impacts Process

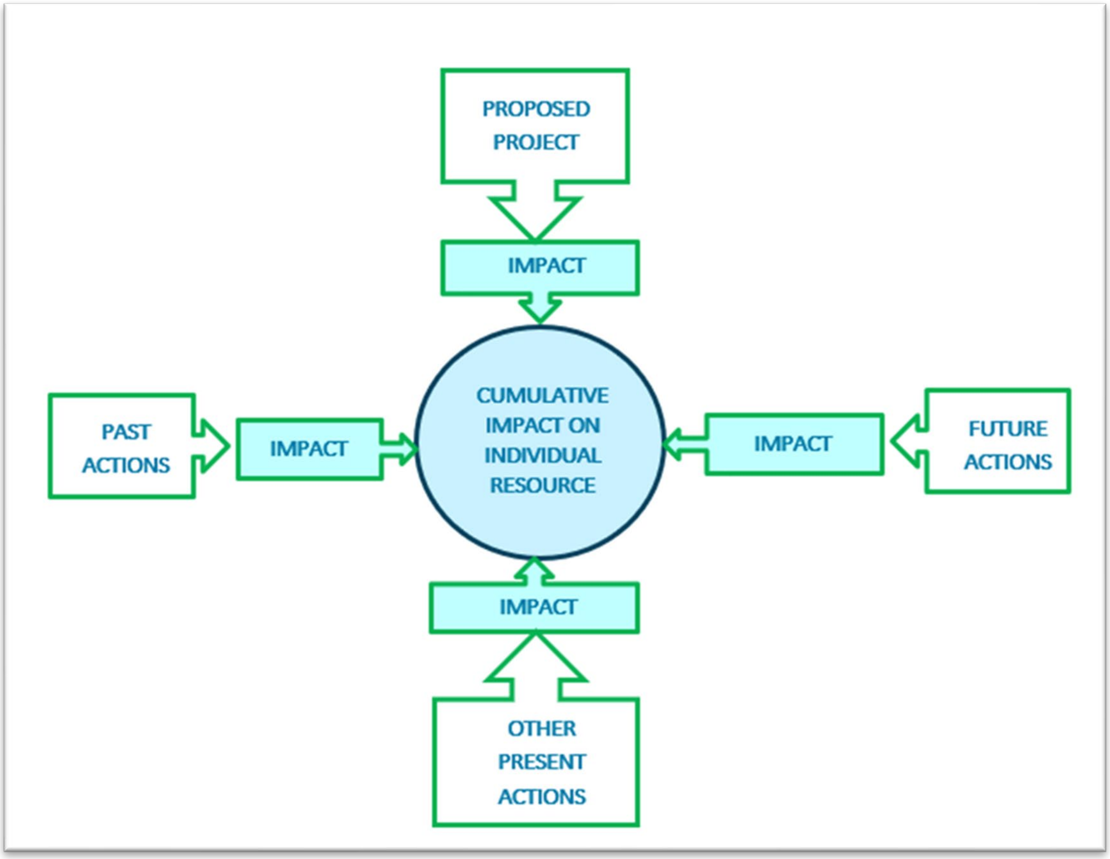


[15] Questions and Answers Regarding the Consideration of Indirect and Cumulative Impacts in the NEPA Process, FHWA, 2014.

Indirect effects may include growth inducing effects and other effects related to induced changes in the pattern of land use, population density or growth rate, and related effects on air and water and other natural systems, including ecosystems. An example of an indirect effect would be when a new roadway is built, and commercial development occurs along that roadway that would not have otherwise occurred without the construction of the roadway. The commercial development would be an indirect effect of the construction of the roadway.

Cumulative impacts are impacts on the environment, which result from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions, see **Figure 15: Flow Chart of Cumulative Impacts**.

Figure 15: Flow Chart of Cumulative Impacts Process



Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time. As an example, induced development in areas without public sewer infrastructure could, when considered with other sources, contribute to the degradation of waterways from increased bacterial levels.

17.1 Indirect Impacts

The NCHRP method outlines an eight-step process for assessing indirect impacts:[16]

- Step 1: Initial Scoping for Indirect Effects Analysis
- Step 2: Identify the Study Area Direction and Goals
- Step 3: Inventory Notable Features
- Step 4: Identify Impact-Causing Activities of Proposed Action and Alternatives
- Step 5: Identify Potentially Significant Indirect Effects for Analysis
- Step 6: Analyze Indirect Effects
- Step 7: Evaluate Analysis Results
- Step 8: Assess Consequences and Develop Mitigation

17.1.1 Step 1: Scoping

Scoping allows for the setting of the environmental baseline for which all effects are compared. Scoping also provides an opportunity for interagency coordination concerning the types of indirect effects to be evaluated and methodologies to be used. This helps to determine the scope and significant issues to be analyzed in depth. Large projects such as the SELL require an intensive scoping process to highlight key environmental concerns and to develop methods to quantify impacts on a large scale.

17.1.2 Step 2: Identify Study Area Direction and Goals

The footprint of the study area for the Indirect Impacts Analysis aligns with the SELL PSA. This area encompasses the 16 alternatives, in addition to providing a regional view of the project. As further studies are conducted, this area may vary depending on the resource being analyzed (i.e. rivers may require study of the entire watershed, while historic resources may be analyzed on a community-level scale).

17.1.3 Step 3: Inventory notable Features in the Study Area

Several facets of the natural, cultural, and human resources within the boundaries of the SELL project were investigated. Through these large-scale studies, four areas were identified that require additional study as related to indirect impacts. These three areas include, water resources (including USACE Jurisdictional rivers, streams, and wetlands as well as water quality), communities, sensitive species, and the WNWR. An overview of the current condition of these resources is noted in their respective sections.

17.1.4 Step 4: Identify Impact-Causing Activities of the Proposed Alternatives

- Encroachment-Alteration Effects (those that alter the functioning of the physical environment)– may include cut/ fill to wetlands, piping of streams, habitat modification, land use conversions, site remediation, cultural and recreational resources impacts, and noise and viewshed changes.

---

[16] NCHRP Desk Reference for Estimating the Indirect Effects of Proposed Transportation Projects. 2002. https://onlinepubs.trb.org/onlinepubs/nchrp/nchrp_rpt_466.pdf

- Access-Alteration Effects (changes in traffic patterns and the alteration of accessibility) – may include reduced travel times, new and expanded access to the built environment, new and expanded access to undeveloped land, and altered circulation patterns. The direct impact of the bridge over the Waccamaw River would be analyzed during this step.

- Induced Growth-Related Effects – may include induced growth-impacts that are attributable to induced growth itself, not project design features.

17.1.5 Step 5: Identify Potentially Significant Indirect Effects for Analysis

17.1.5.1 Encroachment-Alteration Effects:

Ecological Effects:

Transportation corridors have unique impacts on ecosystems associated with their linear form. These corridors may function as specialized habitats, conduits of movement, barriers or filters to movement, or sources of effects on surrounding habitats. Improvements within corridors can have consequences to habitats removed in time and distance from the project. - Habitat fragmentation from physical alteration of the environment, lethal and reproduction effects from pollution, degradation of habitat from pollution; disruption of ecosystem functioning from direct mortality impacts; and, disruption of natural processes (i.e., hydrology, species competition, predator-prey relations, etc.) from altered energy flows.

The ecological indirect effects from the SELL project could come in the form of land-use conversion, habitat fragmentation, and disruption of natural processes. More specifically, water quality degradation of streams and open waters through point and nonpoint source pollution, loss of wetland functions and values, including alterations in surface and sub-surface water storage and retention, reduced pollutant uptake and filtration, and reduced habitat and wildlife diversity. Indirect impacts may result from mowing and other maintenance, and utility installation.

Indirect impacts to protected species can result from increased lighting, increased exposure to invasive species and trash or debris, edge effects, increased potential for pollution from storm water runoff, and long-term increases in noise. In the areas where the direct effects on protected species would occur, indirect effects would occur to the same species occupying the same habitats adjacent to the construction footprint of each alternative.

Socioeconomic Effects:

Encroachment by transportation projects can directly affect the physical nature of a neighborhood or community in various ways such as the alteration of traffic patterns and access; and the relocation of homes and businesses, or relocation of alteration of public facilities. These direct effects can result in indirect effects that can be magnified by the cumulative impacts of other actions. These effects include alterations to the following: neighborhood cohesion, neighborhood stability, travel patterns of commuters and shoppers, recreation patterns at public facilities, pedestrian dependency and mobility, perceived quality of the natural environment personal safety and privacy, and aesthetic and cultural values.

The socioeconomic indirect effects from the SELL project could come in the form of altered travel patterns, impacts to access to facilities, and impacts to community cohesion. Special attention would be focused on EJ communities.

17.1.5.2 Induced Growth Effects:

Transportation improvements often reduce the time-cost of travel, enhancing the attractiveness of surrounding land to developers and consumers. Development on vacant land, or conversion of the built environment to more intensive uses, is often a consequence of highway and transit projects. Growth in population and employment attributable to a direct project effect (change in accessibility) is an indirect effect that, in turn, produces its own effects on the environment.

The methodology for identification of indirect effects of the SELL project would be similar to the process used for the alternative analysis. Matrices and mapping techniques can be combined for a thorough evaluation. Tabulation is necessary at this point to organize the information gathered, and to make explicit the process used to determine indirect effects that are assessed going forward in the detailed analysis.

17.1.6 Step 6: Analyze Indirect Effects

Quantifying the potential of indirect impacts would be completed upon the selection the reasonable alternatives and an investigation of direct impacts as a result of the reasonable alternatives. The key topics outlined in Step 3 (water resources, communities, sensitive species, and the WNWR) are identified in this analysis. Potential techniques used in this analysis could be forecasting tools, comparative case analysis, additional coordination with agencies and the public, as well as a cost/ benefit analysis.

17.1.7 Step 7: Evaluate Analysis Results

There are two key techniques that are of use in evaluating indirect effects analyses: Sensitivity Analysis and Risk analysis. The step of evaluating the indirect impacts analysis is in place to reduce the level of uncertainty inherently embedded in this process.

17.1.8 Step 8: Assess the Consequences and Develop Appropriate Mitigation and Enhancement Strategies

The objective of this step is to assess the consequences of the analyzed indirect effects and develop strategies to address unacceptable indirect effects. For the purpose of the SELL project, special consideration and mitigation strategies could be necessary for impacts to water resources, communities, sensitive species, and the WNWR. Because mitigation of indirect impacts is not always practicable on a project the size of the SELL, these considerations should be part of the evaluation of alternatives to avoid or minimize an indirect effect. Bridging and avoiding USACE jurisdictional wetlands as opposed to filling these areas is an example of avoidance and minimization to reduce the need for mitigation.

17.2 Cumulative Impacts

An assessment of cumulative impacts would focus on the combined effects of SELL Project and other actions on water resources, communities, sensitive species, and the WNWR.

For these four areas of study, the cumulative impacts analysis would be updated to include the current status of the resource and historical trends; summarize the direct and indirect impacts of the proposed action; describe the reasonably foreseeable effects of other actions; and consider mitigation.

Cumulative impact analysis requires careful development of the No build alternative scenario to include reasonably foreseeable future actions. Coordination with agency and local officials is an important part of identifying other projects that should be included in the assessment.

The Council on Environmental Quality (CEQ) guidance identifies methods for analyzing cumulative effects, including: questionnaires, interviews and panels, checklists, matrices, networks and system diagrams, modeling, trends analysis, overlay mapping and geographic information systems, carrying capacity analysis, ecosystem analysis, economic impact analysis and social impact analysis.[17]

- Step 1: Information Gathering – In the case of the SELL project, this step will begin with updating technical data collected.
- Step 2: Initial Assessment of Cumulative Impacts – other RIDE III transportation projects and projects within the study area will be quantified during this step.
- Step 3: Determining Scope and Methodology for Cumulative Impacts Analysis
- Step 4: Conducting the Cumulative Impacts Analysis
    - Phase 1: Describe Resource Conditions and Trends
    - Phase 2: Summarize the Effects of the Proposed Actions on Key Resources
    - Phase 3: Describe other Actions and their Effect on Key Resources
    - Phase 4: Estimate the Combined Effects on Key Resources
    - Phase 5: Consider Minimization and Mitigation

CEQ guidance identifies four basic types of effects that can lead to cumulative impacts:

- Type 1: Repeated additive effects on a resource from a single project.
- Type 2: Stressors from a single project that have interactive (countervailing or synergistic) net effect on a resource.
- Type 3: Additive effects on a resource arising from multiple sources (projects, point sources, or general effects associated with development).
- Type 4: Effects arising from multiple sources that affect resources in an interactive fashion.

[17] CEQ Considering Cumulative Effects under the National Environmental Policy Act" (1997).

Previous concerns noted in the SELL PSA related to cumulative effects include wetlands and drainage, black bears, swallowtail kites, sturgeon and various fish species, water quality, loss of habitat, wood stork rookeries, bald eagles, red-cockaded woodpeckers, spotted turtles, big-eared bats, osprey, migratory songbirds, warblers, sunflowers, and chaffseed. Other items discussed included fire management programs, historic and archeological sites, development of a management plan for the WNWR, and state species of concern.

The largest cumulative effect would come from growth and urban expansion independent of the SELL project. Land-use modelling would need to be employed to identify areas of highest growth and the affected resources. Streams and wetlands that could be affected are prevalent in the area and most likely would be subject to cumulative effects. In addition, water quality could be cumulatively impacted over time by runoff from an increase in impervious areas such as roofs, parking lots, highways, and streets that are associated with growth.

According to the Horry County Comprehensive Plan IMAGINE 2040, economic development centers are expected to increase along US 378 and US 17. Suburban areas are anticipated to experience the most exponential amount of growth located between SC 544 to US 17. Protected/preserved land surrounding the Waccamaw River is not forecasted to receive any development at this stage of County planning. Likewise, the area between the US 501/SC 22 interchange to just west of SC 544 and SC 707 is planned to remain largely rural. Other roadway projects planned within the project area include the construction of Conway Perimeter Road, US 701 safety and intersection improvement projects, rehab/resurfacing projects, and operational/safety projects along and adjacent to US 378, US 501, SC 544, and Cates Bay Highway.

Such proposed projects would expand on currently developed areas surrounding major roadways, particularly within the southern portion of Horry County. No development is forecasted within federal, or state protected lands along the Waccamaw River and much of the SELL study area between the US 501/SC 22 interchange to just west of SC 544 and SC 707 is forecasted to remain largely rural.

Cumulative impacts to EJ populations from the SELL project could occur. The next phase of assessment should include land use modeling to determine areas of potential growth. The results of the land use model would then be compared to the footprint of identified EJ communities to identify overlap and help predict and mitigate impacts.

Cumulative impacts to farmlands would also occur. Farmlands within these alternatives would be converted from present land use to a transportation facility. Land use models should be run for the areas surrounding potential future interchanges. This growth could also impact adjacent farmlands. Cumulative impacts to farmlands would also occur as a result of the induced development if Alternatives 1-15 were selected, coupled with the conversion of farmlands to non-agricultural land uses from other projects in the area, such as the construction of I-73 or other projects.

18 404(B) (1) GUIDELINES

A Conceptual Section 404(b)(1) document was drafted for the SELL Project. This document is typically submitted in connection with a USACE Individual Permit request. The Section 404(b)(1) analysis includes a summary of several features of the natural characteristics of the SELL project.

18.1 Proposed Actions and Alternatives

This 404(b)(1) analysis was prepared in accordance with 40 CFR Part 230, Section 404(b)(1) Guidelines for Specification of Disposal Sites for Dredged or Fill Material (the Guidelines), see **Appendix L: 404(b)1 Memo**. It states and evaluates information regarding the effects or proposed discharge of dredged or fill material into WoUS, including wetlands. As noted in Chapter 1, pursuant to Section 404(b)(1) of the CWA, the USACE may only authorize the practicable alternative with the least damage to aquatic resources unless it has other significant adverse environmental consequences; with practicable alternatives being those that are available and capable of being done after taking into consideration cost, existing technology, and logistics considering the overall project purpose.

Under the Section 404(b)(1) Guidelines, non-water dependent, practicable alternatives not involving special aquatic sites are presumed to have less adverse impact on the aquatic ecosystem, unless clearly demonstrated otherwise. Highway and transit projects generally are not water-dependent activities, and many do, as with the proposed project, impact special aquatic sites.

Of the 16 alternatives, Alternative Corridor 16 would have the least impacts on the environment. Furthermore, no discharge will be permitted if it does any of the following (restrictions):

- Violates any SCDHEC water quality standard,
- Violates any applicable toxic effluent standard or prohibition under Section 307 of the CWA,
- Jeopardizes the continued existence of endangered or threatened species under the Endangered Species

A proposed discharge may not be permitted by the USACE if it would cause or contribute to severe degradation to WoUS, which is based on the factual determinations, evaluations, and tests required. This requires considering individual and collective or cumulative effects. In addition, a discharge may not be permitted by the USACE unless appropriate and practicable steps have been taken to minimize potential adverse effects of the discharge on the aquatic ecosystem (Subpart H of the Guidelines).

18.2 Environmental Impacts of the Proposed Actions and Alternatives

The potential short-term or long-term effects of a proposed discharge of dredged or fill material on the physical, chemical, and biological components of the aquatic environment must be determined. The following discussion provides a brief analysis for each of the factors or criteria that must be considered. This analysis will be a broad overview due to the conceptual nature of the project alternatives. A more detailed analysis may be given at a later date when the number of alternative corridors considered for the SELL project are narrowed down and design is at a later stage.

18.2.1 Effects of Proposed Actions on Substrates

Aquatic ecosystem substrates underlie open waters of the U.S. and constitute the ground surface in wetlands. Substrates include physical, chemical, and organic materials necessary for the sustenance of the ecosystem. Direct impacts would occur to substrates from the placement of new and/or existing roadway such as structural fill, culverts, and bridge piers and abutments for each of the build alternatives. Indirect impacts could result from roadway runoff and human activity from increased access to WoUS. Much of the project footprint for Alternative Corridors 1 through 13 is undeveloped and therefore, would cause significantly more impact to aquatic resources and the associated substrate. Ultimately, Alternative Corridor 16 proposes the least amount of fill/cut to WoUS and therefore, the least amount of permanent substrate impacts.

18.2.2 Effect of Proposed Actions on Turbidity

Disturbance of wetlands and other WoUS during construction might create turbid conditions that could reduce light penetration in affected waters, adversely affecting aquatic organisms by lowering photosynthesis, increasing temperatures, lowering oxygen levels and primary aquatic system productivity, and interfering with feeding activity for sighted organisms. Because of greater number of delineated wetlands and other waters, the alternatives with the largest construction footprint covering the greatest number of delineated aquatic resources (Alternative Corridors 3 and 4) would have a greater potential for these effects. Ultimately, Alternative Corridor 16 proposes the least amount of fill/cut to WoUS and therefore, would be expected to have the least impacts to suspended particulates/turbidity. In general, however, the maximum practical means to control particulates and turbidity impacts would be employed and minor for whichever build alternative is chosen.

Temporary best management practices (BMPs) (soil stabilization, sediment control, wind erosion control, tracking control, non-storm-water management, and waste management and materials pollution control) would be implemented where feasible to contain both storm water and non-storm-water discharges during construction. With the inclusion of BMPs, the project would not negatively affect water quality in the corridor on a long-term basis.

18.2.3 Effects of Proposed Actions on Contaminants

All build alternatives of the project have the potential to introduce contaminants into WoUS during construction, operation, and maintenance. Direct impacts would result from contaminant spills or migration into WoUS during construction or operations. Indirect impacts could result from the transport of contaminants into WoUS in runoff from existing sources or from the roadway surface. BMPs would be evaluated, implemented, and maintained to address these impacts during the planning and design, construction, and operational phases regardless of the build alternative chosen.

The size of the construction zone and the amount of impervious surface area proposed in the completed project are rough measures of each alternative's potential to generate pollutants in runoff. In general, water quality controls would be required equally of all the build alternatives, but Alternative Corridor 16 would have the least impacts to WoUS due to its smaller area of proposed impervious surfaces. Alternative Corridors 3 and 4 have the largest impacts due to the size of its construction zone and number of wetlands and other WoUS.

18.2.4 Potential Impacts on Biological Characteristics of Aquatic Ecosystems

18.2.4.1 Threatened and Endangered Species:

Due to the preliminary stage of analysis for the SELL project, no threatened and endangered species field surveys were conducted within each alternative corridor. A desktop review for any observed sighting of federal or state listed protected species was conducted December 2022 using the South Carolina Natural Heritage Database. The PSA was analyzed within the context of all 16 alternative corridors.

Based on initial desktop review, several sightings of federal and state protected species were identified. These include the following:

1. Bald eagle was observed in 2022 at Lake Busbee, within 1 mile of Alternative Corridors 14-16.
2. American chaffseed was observed in 1954 (possibly extirpated now) just east of SC 544 and just south of US 378. This observed sighting is located right within Alternative Corridors 15 and 16. Another American chaffseed sighting was observed in 1985 (possibly historic) west of US 17 and just south of Freewoods Road. No alternative corridor is located at this sighting.
3. A Rafinesque's big-eared bat roost was observed in 2022 along US 701 at the southernmost portion of the PSA. No alternative corridor is located at this location.

A more detailed analysis of impacts to threatened and endangered species is addressed in Section 6.1: Potential Impacts to Threatened and Endangered Species.

18.2.4.2 Fish, Crustaceans, Mollusks, and Other Aquatic Organisms

Each of the build alternatives would result in permanent, direct impacts to aquatic species. Permanent, indirect impacts to aquatic organisms could occur from increased pollution runoff due to additional highway traffic, resulting in potential loss of individual species and increased nonnative species plant intrusion, with potential loss of the habitats necessary to support these species.

Temporary impacts to aquatic organisms in the food web could result from turbidity, sedimentation, pollution, and contamination that could occur during construction and operation of the proposed facility. Impacts may also be greater to fish, crustaceans, mollusks, and other aquatic organisms the further downstream along the Waccamaw River due to closer proximity to Winyah Bay and where the Intracoastal Waterway drains into the Waccamaw River. Such alternatives that are located further south include Alternative Corridors 1 through 6 and 10 through 13.

18.2.4.3 Impacts on Essential Fish Habitat

Essential Fish Habitat (EFH) is identified in the Magnuson-Stevens Fishery Conservation and Management Act as "those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity." Essential Fish Habitat does exist along the Waccamaw River and Intracoastal Waterway under Alternative Corridors 1 through 6 and 10 through 16. Construction of new bridge pilings and fill placed along the abutments could directly impact EFH. BMPs for water quality would be part of the project and would control these indirect runoff impacts under all build alternatives. Based on current NOAA EFH mapping, no EFH is identified under Alternative Corridors 7 through 9. Therefore, these corridors are the least damaging to EFH.

18.2.4.4 Other Wildlife and Wildlife Corridors

Alternative Corridors 1 through 15 cross the Waccamaw Wildlife Refuge, which was established on December 1, 1997 to protect and manage diverse habitat within coastal river ecosystems and to provide wildlife-dependent recreational activities such as hunting, fishing, wildlife observation, photography and environmental education. The wetland diversity within the refuge provides important habitat for migratory birds, fish and other wildlife. This refuge provides biological value as habitat for resident species and also allows for migration, genetic exchange, and general movement of common, sensitive, and protected wildlife. Discharge of fill material associated with all of the build alternatives except Alternative Corridor 16 may eliminate or change breeding and nesting areas, destroy escape cover, increase edge effects, alter travel corridors, or remove preferred food sources for resident aquatic species and associated other species. Impacts to corridor crossings between streams, wetlands, and upland could affect small mammals, reptiles, and amphibians. Bird species movement is not as likely to be adversely affected by movement corridor impacts as they can fly over the roadway. However, their nests may be directly impacted.

18.3 Actions Taken to Minimize Adverse Effects

18.3.1 Wetland/Special Aquatic Site/Other Waters Impact Minimization Efforts

Many impacts to WoUS would be unavoidable due to the project size necessary to accomplish the purpose and need. An effort to minimize impacts is an objective of the design effort for each of the build alternatives. Some examples might include:

- New or existing roadway profiles would be minimized to reduce the width and overall footprint of the roadway to minimize wetlands and right-of-way impacts.
- Wildlife corridors adjacent to the proposed bridge along the Waccamaw River, or suitably wide shoulders along the paved bridge to allow safe crossings for species local to the Waccamaw Wildlife Refuge and surrounding protected areas.
- Proper hydrology studies will be conducted to determine the optimum channel dimensions/cross-sections, combined with bridge lengths, and culvert/pipe/riprap impacts to optimize flood condition flows at each stream crossing with the least amount of impacts to WoUS.

18.3.2 Conservation Measures

Conservation measures would be required for implementation of any of the sixteen (16) alternatives: Some examples are listed and a comprehensive list is available in **Appendix L**.

- Formal threatened and endangered species surveys will be conducted prior to construction to verify the presence or lack of species/suitable habitat.
- Sediment and erosion control measures, consistent with South Carolina BMPs, would be installed during construction of the project to prevent runoff and sedimentation to WoUS.

- Cut slopes and temporary impact areas would be revegetated with native upland habitats with composition similar to those habitats within the Waccamaw Wildlife Refuge if and when feasible.

18.3.3 Compensatory Mitigation

Mitigation bank(s) with service areas located within the preferred build alternative would be utilized where impacts to WoUS would take place. In the absence of available mitigation banks or wetland and stream credits in the proposed area of impact, a Permittee-Responsible Mitigation (PRM) plan would be developed. A PRM is defined in 33 CFR Part 332 as "an aquatic resource restoration, establishment, enhancement and/or preservation activity undertaken by the permittee (or an authorized agent or contractor) to provide compensatory mitigation for which the permittee retains full responsibility." This type of mitigation may also be referred to as "project-specific mitigation." This form of mitigation would require approval by the USACE and other governmental agencies.

18.3.4 Preliminary LEPDA Identification and Consideration of Other Section 404 Discharge Requirements/Restrictions

Since the aquatic resource full avoidance alternatives are not practicable, and because each of the SELL build alternatives would result in some aquatic resource loss, the practicable alternative with the least damage to aquatic resources must be identified as the least environmentally damaging practicable alternative (LEDPA), unless it has other significant adverse environmental consequences.

Based on preliminary analysis, the alternative with the lowest environmental impacts appears to be Alternative Corridor 16. The LEDPA must be a reasonable and practicable alternative and must be considered in the alternatives screening process. At this point in the project process, 16 conceptual alternatives have been proposed and impacts have been estimated. Following a detailed tiered alternatives screening to determine if the alternatives meet the project purpose and need, a LEDPA can be recommended.

19 PUBLIC INTEREST REVIEW FACTORS

The USACE has been involved in regulating certain activities in the nation's waters since 1890. Until 1968, the primary activity of the USACE regulatory program was the protection of navigation. As a result of several laws and judicial decisions, the program has evolved to one involving the consideration of the full public interest by balancing the favorable impacts against the detrimental impacts. This is known as the "public interest review". The USACE public interest review is the main framework for the overall evaluation of projects. The USACE seeks to avoid unnecessary regulatory controls. The public interest review is used to evaluate applications under all authorities administered by the USACE. The public interest review requires the careful weighing of all public interest factors relevant to each particular permit application. Thus, one specific factor (e.g., fish and wildlife values or economics) cannot by itself force a specific decision, but rather the decision represents the net effect of balancing all public interest factors, many of which are frequently in conflict. During the review of a permit application, the USACE evaluates the following public interest review factors: conservation, economics, aesthetics, general environmental concerns, wetlands, historic properties, fish and wildlife values, flood hazards, floodplain values, land use, navigation, shore erosion and accretion, recreation, water supply and conservation, water quality, energy needs, safety, food and fiber production, mineral needs, considerations of property ownership, and the needs and welfare of the people.

The first public interest review factor that is addressed currently is economics which evaluates and assumes that appropriate economic evaluations have been completed, that the proposal is economically viable, and is needed in the marketplace. Another factor is aesthetics or visual impacts which evaluates if the project being proposed may impede or enhance a visual resource or the current aesthetic of the site. Wetlands is an important resource and are a productive and valuable public factor that serve various biological functions such as food chain production and general habitat for nesting and spawning for both aquatic and land species. Other values that are also currently addressed are fish and wildlife values and other natural resources. Additionally, floodplain values such as natural moderation of floods and flood hazards considerations are reviewed in the public interest analysis. Land use, describing the human use of the land such as agriculture or residential use is also considered. The last two factors include property ownership considerations such as a property owners general right to protect property from erosion or right of access to navigable waters of the US and displacements, and the needs and welfare of the people along with environmental justice. Other factors that will be addressed later in the project development prior to submitting a permit application are conservation, general environmental concerns, historic properties, navigation, shore erosion and accretion, recreation, water supply and conservation, water quality, energy needs, safety, food and fiber production, and mineral needs.

Alternatives 1 through 16 are expected to have an overall beneficial effect on economics and the needs and welfare of people. These economic benefits would come about due to the creation of a new highway route. From a conceptual overview, each of these alternative routes would impact land use, floodplains, fish and wildlife values, wetlands, historic properties, and aesthetics or visual impacts (see Table 3: Environmental Impact Matrix). A factor that will not be affected or is uniform throughout each alternative is air quality. Other factors including conservation, general environmental concerns, navigation, shore erosion and accretion, recreation, water supply and conservation, water quality, energy needs, safety, food and fiber production, and mineral needs will be evaluated in the project development for the reasonable and practicable alternatives, prior to submitting a permit application.

20 MITIGATION

Because there is no alternative that completely avoids impacts to WoUS, a mitigation analysis was conducted to better understand the potential for compensatory mitigation within the PSA (**Appendix M: SELL Mitigation Needs Analysis**). A preliminary evaluation to assess planning, feasibility, costs, and scheduling was completed based on the range of conceptual alternatives identified at this time. Based on the analysis study, the SELL project is expected to have significant impacts to aquatic resources, both wetlands and streams. With the landscape-scale impacts associated with the SELL project, a landscape-scale component of compensatory mitigation action will be appropriate. Presently, there are insufficient mitigation banks that have readily available credits to fulfill the total of estimated wetland and stream mitigation needs of the SELL project. Existing approved migration banks with available credits are shown in **Table 16: Mitigation Bank Credit Availability**.

Table 16: Mitigation Bank Credit Availability

Mitigation Bank Name	Bank Service Area	Wetland Credits Available?	Stream Credits Available?
Carter Stilley	Primary	Yes	Yes
Waccamaw	Primary	Yes	No
Town Creek Headwaters	Primary	Yes (very limited)	No
NCDMS Swamp Grape	Primary	Yes (very limited)	Yes

Source: USACE, Regulatory In-Lieu Fee and Bank Information Tracking System, May 2023.

A hybrid approach to compensatory mitigation has been employed in South Carolina for projects with comparative impacts to SELL. The hybrid approach utilizes both acquisition of available mitigation banking credits from approved mitigation banks and use of Permitee-Responsible Mitigation (PRM). Costs associated with an adequate and complete mitigation plan will depend on the compensatory mitigation needs of the approved and final alternative alignment of the SELL project. The total mitigation costs range is anticipated to be between $30 million and $40 million given the present information. Based on the above information, the following future actions are proposed:

- Confirm the preferred SELL alignment alternative and submit a Clean Water Act Section 404 permit application
- Confirm the mitigation approach with the project sponsor, USACE, SCDOT and project team.
- Refine a compensatory mitigation budget for the project.
- Continue to monitor existing and pending mitigation banks that serve the SELL project area.
- Schedule meetings with the project team to discuss mitigation alternatives and schedule site visits to evaluate high priority tracts for conceptual PRM planning.
- Conduct site visits for reconnaissance as prioritized and recommended by the project team.
- Discuss long-term stewardship opportunities for mitigation acreage with USFWS and SCDNR.

21 CONCLUSIONS

Horry County has a goal to provide the region with congestion relief, improved hurricane evacuation, and improved access to needed services east and west of the Waccamaw River. For this effort, 17 conceptual alternatives were developed including the No-Build Alternative. In the future, these Conceptual Alternatives will be assessed and updated through the public involvement process. They will be evaluated with screening criteria to determine if they meet the purpose and need and to determine which alternatives are reasonable and practicable. If an alternative does not meet the screening criteria metrics, it will not be further considered as a Reasonable Alternative. Reasonable Alternatives will also be assessed for potential impacts to the natural and human environment. Finally, the Proposed Reasonable Alternative that best balances the potential impacts to the human and natural environment will be recommended as the Preferred Alternative.

In the future, public involvement, mitigation planning, and a Section 404 permit application would be prepared by Horry County for submittal to the USACE.

1 Introduction

STV, in cooperation with CECS, has been contracted by the South Carolina Department of Transportation (SCDOT) to provide travel demand modeling, development and evaluation of conceptual Southern Evacuation Lifeline (SELL) alternatives. Travel demand modeling was performed using the Grand Strand Area Transportation Study (GSATS) travel demand model. The GSATS model runs in TransCAD Version 7.0 Build 12280 (64-bit). The GSATS model was selected as it allows for assessments of changes to the roadway network at a regional level. Additional traffic studies will be completed at a later date to analyze specific impacts, such as intersection lane configurations and interchange types.

The purpose of the travel demand modeling effort was to incorporate conceptual SELL alternatives into the travel demand model and use model outputs to assess the estimated amount of traffic that would be carried by each alternative. These alternatives consisted of alternatives on new alignment, alternatives on a combination of widened existing roadway facilities with several short new alignment segments, and an alternative consisting of widened existing roadway facilities with no new alignment segments.

The results of the analysis are intended to assess the conceptual alternatives to determine if they meet the project purpose and need. The new alignment alternatives begin at an expanded interchange at US 501 and SC 22 (Conway Bypass) with the southern end located either along US 17 near Surfside Beach or along SC 31 (Carolina Bays Parkway) at a point between SC 544 and US 501. Three alternatives make use of expanded existing roadways. The northern end of these alternatives begins on US 501 at the SC 22 interchange with the southern end of these alternatives located on SC 544 at US 17 Bypass. These alternatives include portions of US 501 and/or portions of the Conway Perimeter Road. Two of the alternatives incorporate short sections of new alignment connections between existing roadways.

This Travel Demand Modeling Technical Report will:

- Discuss the use of the GSATS model in assessing the SELL alternatives.
- Depict the SELL alternatives in the context of the regional travel demand model network.
- Summarize the segment volumes for each of the SELL alternatives.
- Summarize potential measures of effectiveness (MOE) for comparisons of the individual SELL alternatives.
- Depict model ‘turn movement’ assignments at key interchange and arterial intersections to provide preliminary guidance for the type and size of interchanges.

1.1 SELL Study Area

The current GSATS model was released for use in late 2016 in support of the 2040 Metropolitan Transportation Plan. The model incorporates all of Georgetown and Horry counties in South Carolina and portions of Brunswick County in North Carolina. The study area for the SELL project is a portion of the overall GSATS model and is generally located in southwest Horry County in an area bounded by the Georgetown County line, US 17, SC 544, and US 501. The northern terminus of the SELL project is the existing interchange of US 501 and the Conway Bypass (SC 22).

The SELL study area in the context of the GSATS model is shown in **Figure 1**.

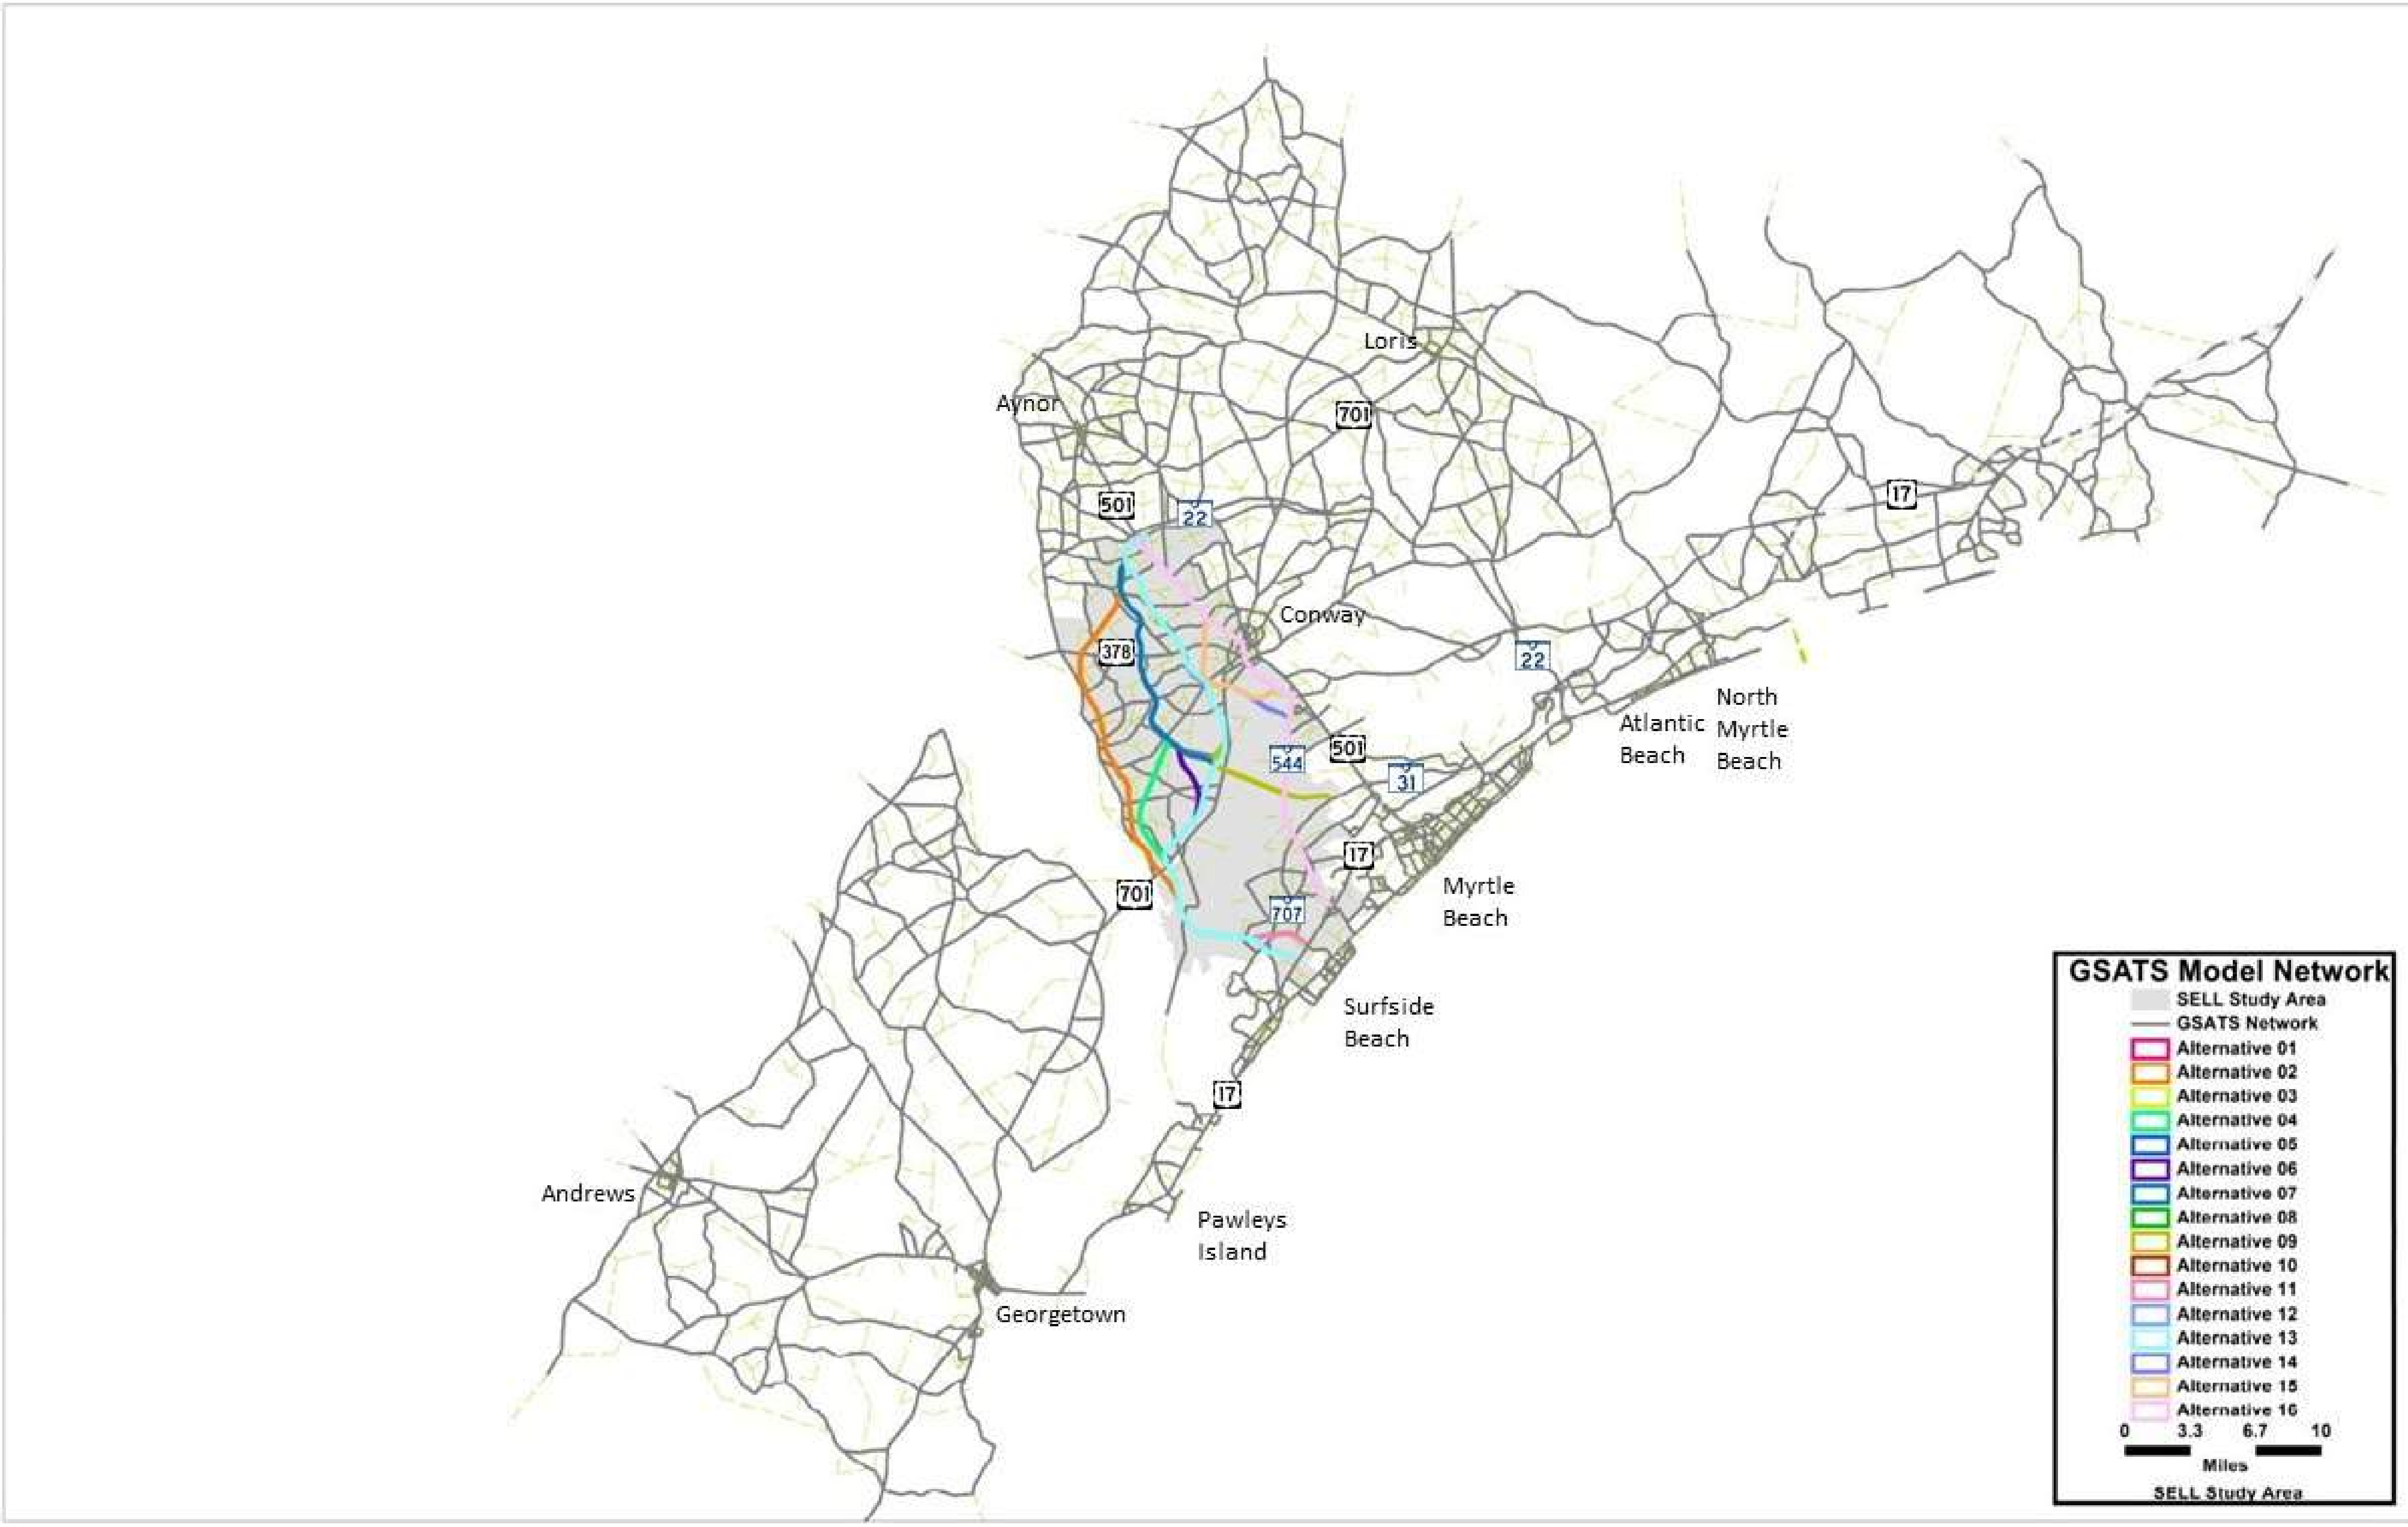

Figure 1 - SELL Study Area within GSATS Network

2 Existing Conditions and Projected Growth

The South Carolina Statewide Model (SCSWM) and the GSATS travel demand models were considered for use in performing the travel demand modeling activities. The project team determined that the 2040 GSATS model would be the appropriate platform for the travel demand modeling needs of this project, at the time of this analysis and report.

The project scope called for a 2050 design year, which is ten years beyond the current model's 2040 design year. To project traffic from 2040 to 2050 would require either creating new land use files for the 2050 model or applying a scalar factor to the model assignment results based on population growth and 2020 census data.

Traffic in the GSATS model is generated based on socio-economic data contained in traffic analysis zones (TAZ) that make up smaller geographic subareas within the model. The GSATS model has a total of 721 TAZ, with 684 TAZ used for generating trip productions and attractions based on zonal socio-economic data within the land use files. Land use files are provided for 2015, 2020, 2025, 2030, 2035, and 2040 regional development scenarios.

The socio-economic data in the land use files within the GSATS model do not explicitly incorporate residential or employment population estimates within the individual TAZ. Instead, the trip generation step that leads to the estimation of productions and attractions by each TAZ are estimated using proxies for residential and employment population. Trip productions are based on the number of dwelling units in each zone, while trip attractions are based by employment estimates derived from the number of hotel/motel rooms, and the estimated amount of acreage for recreation, utility, industrial, public/semi-public, and commercial development within each TAZ.

Efforts were made to take the previous TAZ socio-economic inputs used in the development of the 2040 GSATS model and adjust them to provide an unrefined estimated of 2045 and 2050 land use values for use in running traffic assignments for those years. The available information within the model's land use files were reviewed against past socio-economic data distribution spreadsheets to see if growth could be extended from those previous calculations. The intent was to use a socio-economic inputs and forecasts that were used in the 2040 GSATS model for 2015, 2020, 2025, 2030, 2035, and 2040 as a starting point and use more recent population forecasts generated by the South Carolina Revenue and Fiscal Affairs Office (SCRFAO) to adjust the 2040 land use forecasts to estimate 2050 conditions. However, since there is no direct connection between the regional population forecasts and the socio-economic inputs for dwelling units and development acreage and hotel/motel rooms, a reasonable and defensible process for increasing the model's land use inputs could not be developed.

It is decided to advance the study using the current 2040 GSATS land use data and update the model runs in the future when 2050 land use data is developed. The resulting 2040 volume assignments will likely be lower than the 2050 results would be. As an interim step until the 2050 land use data is ready, the 2040 model results may be factored manually prior to using the updated land use. However, adjustments to the volumes must be carefully made since some portions of the alternatives contain segments in a portion of the GSATS area which had previously not experienced much growth compared to the more heavily urbanized and developed areas along US 501 and US 17.

3 Development of the SELL Model Alternatives

The development of the SELL alternatives in the calibrated GSATS 2040 travel demand model involved obtaining the current model, reviewing the model structure and documentation, performing test runs to ensure the model was performing correctly, and developing the various SELL alternative alignments within the model. Individual 2040 model assignments were run for each of the SELL alternatives.

3.1 Obtaining and Reviewing of the GSATS Travel Demand Model

The 2040 GSATS travel demand model files were requested from the Waccamaw Regional Council of Governments, the planning agency that applies the GSATS model as part of their long-range planning process. The files were received from CDM Smith, the consultant who is under contract to build and maintain the current 2040 GSATS model.

The model documentation and network structure were reviewed, and a test run of the 2040 Existing plus Committed (E+C) project network was performed. The Committed projects include those listed in the Statewide Improvement Plan, the Rural Transportation Improvement Plan, and the 2015-2019 Transportation Improvement Plan as of December 2016.

3.2 Network and Zone Changes

No changes to the GSATS model zone structure was made for any of the network TAZ files.

A Google Earth *kmz* file containing each of the 16 roadway alternative scenario alignments and callouts indicating the locations of the all the various alternative segments was provided for use in incorporating the alternatives into the GSATS E+C network. This *kmz* file was created from MicroStation files depicting the conceptual alternatives. **Figure 2** depicts the various individual segments making up the potential alignment alternatives. **Table 1** shows which segments depicted in **Figure 2** were used to construct each of the 16 Alternatives.

A review of the sixteen alternative scenarios indicated that there were alternatives which were largely identical except for one or several segments that were not likely to impact the model assignments. These segments were of comparable length and/or not separated far from segments in otherwise identical alternatives. In these cases, one alternative was selected to represent the two similar alternatives. This resulted in combining ten of the 16 roadway alternatives to five alternatives to be tested in the GSATS model. This reduced the total number of modeled alignment alternatives from 16 roadway alternatives to 11 SELL GSATS model alternatives.

- Alternative 1 -> SELL 01
- Alternative 2 -> SELL 02
- Alternative 3 & Alternative 5 -> SELL 03
- Alternative 4 & Alternative 6 -> SELL 04
- Alternative 7 -> SELL 05
- Alternative 8 & Alternative 9 -> SELL 06
- Alternative 10 & Alternative 11 -> SELL 07
- Alternative 12 & Alternative 13 -> SELL 08
- Alternative 14 -> SELL 09
- Alternative 15 -> SELL 10
- Alternative 16 -> SELL 11

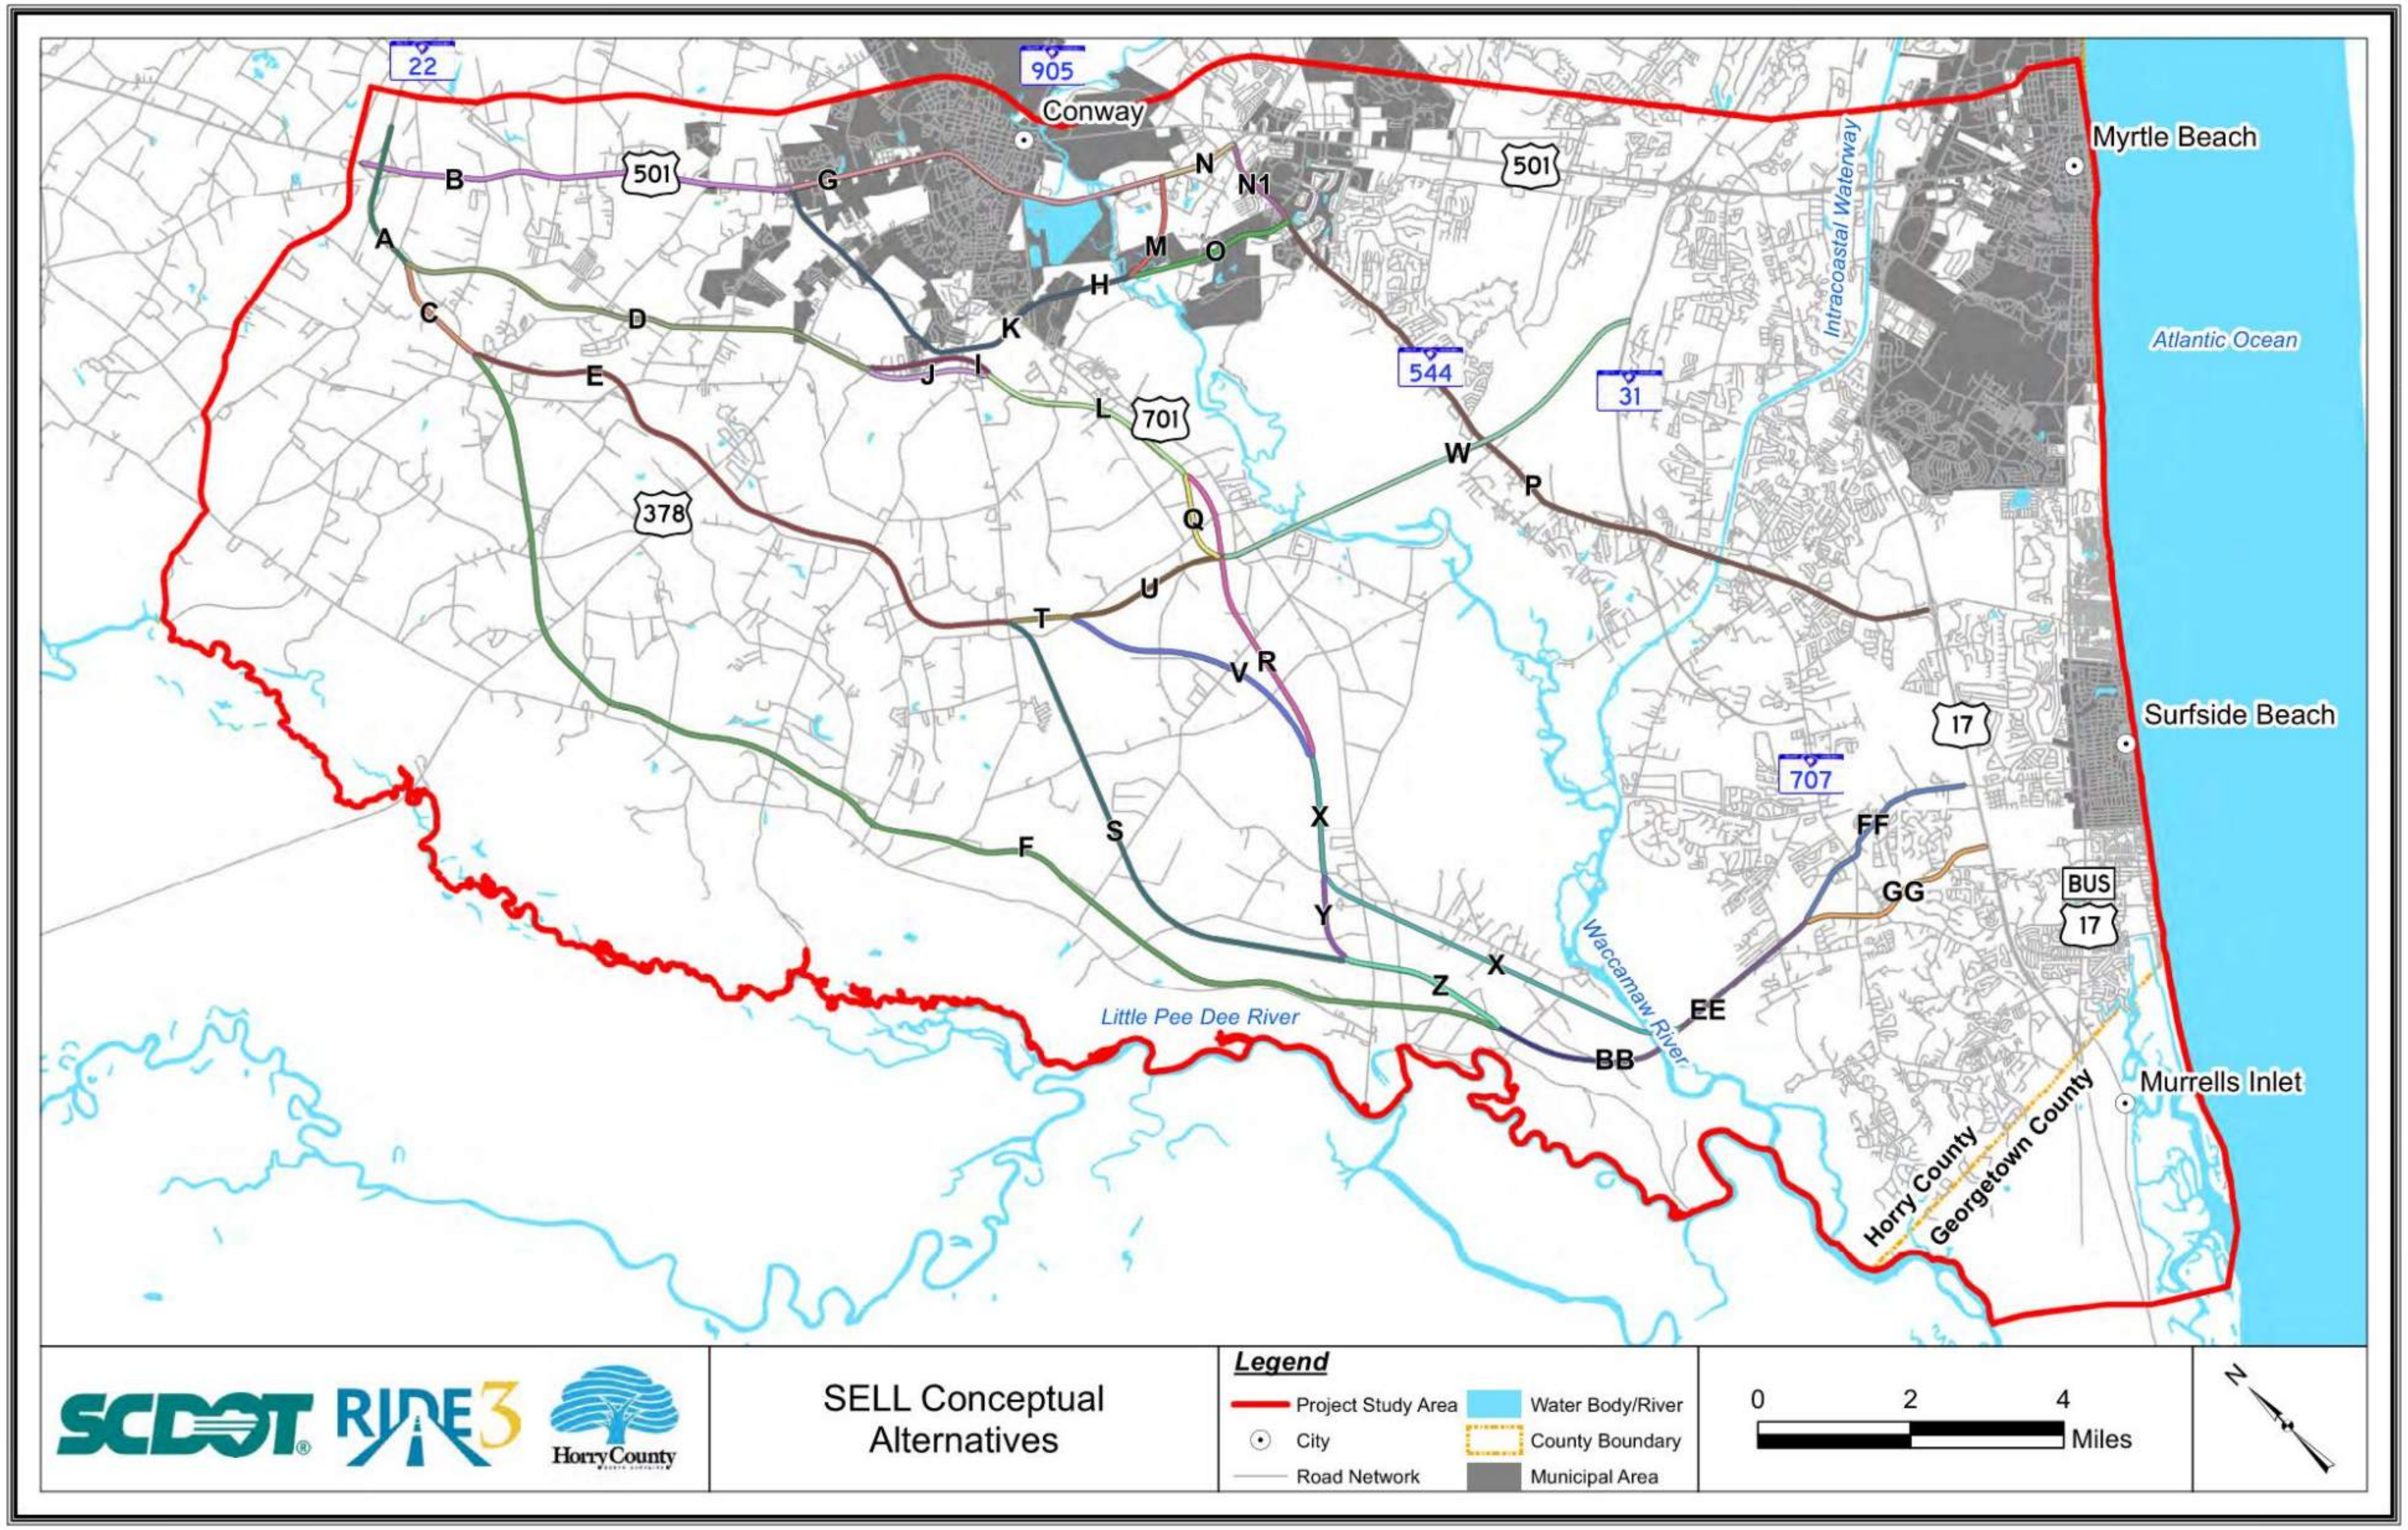

Figure 2 - SELL Alternative Segments

9	A	D	I	L	Q	W					
10	A	D	J	L	R	X	Y	Z	BB	EE	FF
11	A	D	I	L	R	X	Y	Z	BB	EE	FF
12	A	D	J	L	R	X	Y	Z	BB	EE	GG
13	A	D	I	L	R	X	Y	Z	BB	EE	GG
14	B	H	K	O	P						
15	B	H	K	M	N	N1	P				
16	B	G	N	N1	P						

Embedded in the *kmz* files were layers that outlined the boundaries of each of the 16 roadway alternatives. The Alternatives within the overall SELL Alternatives *kmz* file were saved as individual *kmz* files from Google Earth. Each of the 16 individual roadway alternatives files were then imported into the GSATS model as 'Area' files and saved into separate subfolders for their respective alternative. Once all sixteen roadway alternative *kmz* files had been imported and saved, they were then able to be added individually as separate background area layers to assist in modifying the networks to incorporate the SELL alternatives. Individual SELL Alternative scenarios are discussed in more detail in **Section 4**.

With all the alternative areas visible as background layers in the GSATS network, the 2040 E+C network was reviewed along the alternatives to determine if any areas of the base network needed to be edited to incorporate transportation facility improvements that have already been constructed. The network links were compared against the aerial photo backgrounds in Google Earth and recently constructed improvements that were not included in the 2040 E+C network were identified. The network was then modified to incorporate the single recently constructed improvement. These edits consisted of:

- Modifying the interchange at SC 544 and SC 31 (Carolina Bays Parkway) to add a loop ramp from southbound SC 544 to eastbound SC 31. This loop ramp was opened to traffic in 2019.

One other network improvement within the SELL study area that was not within the 2040 networks was identified as likely to be constructed and open to traffic prior to 2040. This network was adjusted to include:

- The extension of El Bethel Road as part of the Conway Perimeter Road project. This roadway was extended from its current terminus on US 378 to the south and then east to its terminus at US 701. The extension also included an intersection with Cates Bay Highway and the relocation of Dirty Branch Road from its intersection with Cates Bay Highway to a new intersection with the Conway Perimeter Road north of Cates Bay Highway.

A separate primary GSATS 2040 SELL network was created to keep the original network files unmodified and in the state in which they were received. It was decided to code all the new SELL segments for all the SELL alignments into this separate primary network rather than code each of the ten SELL alternatives incorporating new links separately. Coding all the segments into one network ensures that identical links would have the same link number throughout each of the alternatives. Coding the SELL new alignment segments into one network also expedited the coding process (each segment only had to be coded once) and facilitates the comparison of the same link between model runs for the different alternatives. Coding multiple SELL alternatives individually could end up with the layout of the same individual segments not being consistent between alternatives, could end up with a segment that is part of multiple SELL alternatives to have a different link number between the alternatives, and avoids having different segments in different SELL alternatives having the same link number.

Once all the SELL segments were coded into the primary network, the network was exported to create the individual SELL alternative networks. Each individual SELL alternative network was then edited and the new alignment segments that would not be included in a specific SELL alternative was eliminated.

Several network changes were made in the primary SELL network containing all SELL new alignment segments:

- The existing interchange of US 501 and US 22 (Conway Bypass) was modified to provide full access to Alternatives 1-13 (GSATS SELL alternatives 1 through 8).
- An interchange that was present in the 2040 LRP network on SC 701 at Holmestown Road was incorporated into Alternatives 1, 3, 5, 10, and 11 (GSATS SELL Alternatives 1, 3, and 7). Adjustments were made to the network on SC 701 and Holmestown Road in that area for Alternatives 1, 3, 5, 10, and 11 (GSATS SELL Alternatives 1, 3, and 7), while the current 2040 E+C network coding was maintained for Alternatives 2, 4, 6, 7, 8, 9, 12, and 13 (SELL Alternatives 2, 4, 5, 6, and 8).

Aside from these locations, no other interchanges were explicitly coded in the network. Interchanges were coded as typical intersections at a single node.

While eight of the 11 GSATS SELL alternative networks consisted primarily of adding new segments to create the SELL alternative alignments, two GSATS SELL alternatives consisted of a combination of new alignment segments and improvements to existing network segments. The following network changes were made for those two alternatives:

- A centroid connector 359 from Traffic Analysis Zone (TAZ) 1243347 was eliminated for Alternatives 14 and 15 (GSATS SELL Alternatives 9 and 10). In Alternatives 14 and 15, an additional new alignment extension of the Conway Perimeter Road would create an intersection at New Road where centroid connector 359 had been entering the network in Alternatives 1 through 13 (SELL Alternatives 1 through 8). The centroid connector was eliminated since typical modeling practice is to avoid attaching centroid connectors at intersections.

Alternatives 14, 15, and 16 (SELL Alternatives 9, 10, and 11) also incorporated improvements to existing arterial roadways, such as SC 544 and US 501. The improvements consisted of increasing the total number of lanes on each link to provide two additional lanes. Alternatives 16 (SELL Alternative 11) is the only alternative that does not include new SELL segments and is made up entirely of adjustments to existing roadway links. The network edits for these alternatives were made in the individual SELL Alternative network files.

3.3 I-73 Network Links

For many years, I-73 has been under development by SCDOT. I-73 is a proposed new alignment limited-access interstate route with a southern terminus on US 22 east of the US 501 interchange that would run to the northwest to Rockingham, NC. Outside of the SELL study area, I-73 would run generally parallel to US 501 with a connection with I-95.

I-73 was not included in the GSATS 2040 E+C model network. Therefore, it was not included as part of the modeling of the SELL alternatives and its potential influence is not included in the traffic forecasts developed. Should it become necessary at a later date to include I-73, appropriate modifications will be made to the SELL alternative model networks.

3.4 Calibration

The calibrated 2040 E+C network was used as the basis of the creation of the eleven SELL alternatives.

4 Scenarios Evaluated

4.1 Conceptual Alternatives Considered

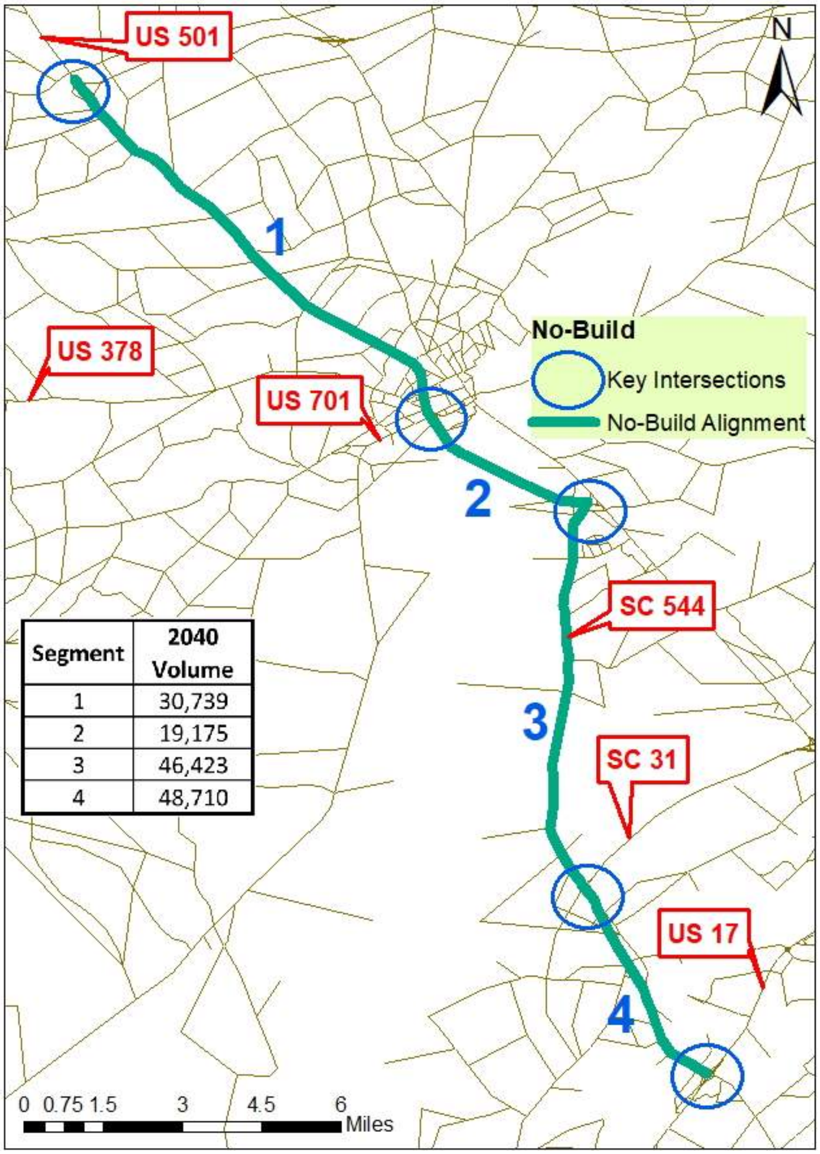
Roadway Alternatives 1 through 13 (GSATS SELL Alternatives 1 through 8) are all new alignments. Roadway Alternatives 14 and 15 (GSATS SELL Alternatives 9 and 10) are a combination of the new alignments and the existing routes. Roadway Alternative 16 (GSATS SELL Alternative 11) is entirely on existing routes. For the Alternatives that incorporate the existing routes, the existing arterials alignments will be widened by two lanes. All new alignments were initially modeled as four-lane expressways. After initial model runs were completed, the new alignments were modeled as six lane expressways to accommodate the traffic projections and address the high levels of congestion observed in the initial results.

The No-Build Alternative consists of the currently coded GSATS 2040 E+C Model network. For evaluation purposes, the no-build alternative will be generally defined as US 501 between the SC 22 interchange and SC 544, and SC 544 between US 501 and US 17. This is comparable to Roadway Alternative 16 (GSATS SELL Alternative 11) without the widening of the existing arterial alignment by two lanes.

The no-build alternative and the eleven future year 2040 GSATS SELL Alternatives, made up of the original 16 roadway alternatives, are described beginning on the next page. Each alternative description includes a figure depicting the alternative alignment, key segments, locations of interchanges or major intersections along the alternative alignment, labels identifying major routes, and projected 2040 average daily peak-season traffic volumes.

4.1.1 No-Build Alternative

The route used to evaluate the No-Build Alternative against the proposed SELL Alternatives begins on US 501 at the SC 22 interchange, then follows the existing alignment along US 501 to the southeast direction before turning to the south on the existing alignment along SC 544 to its terminus at US 17. This alternative, which is comparable to the Alternative 16 route alignment, is 23.8 miles long and has multiple at grade intersections throughout its length. The No-Build Alternative and the 2040 volume assignments are shown in **Figure 3**.

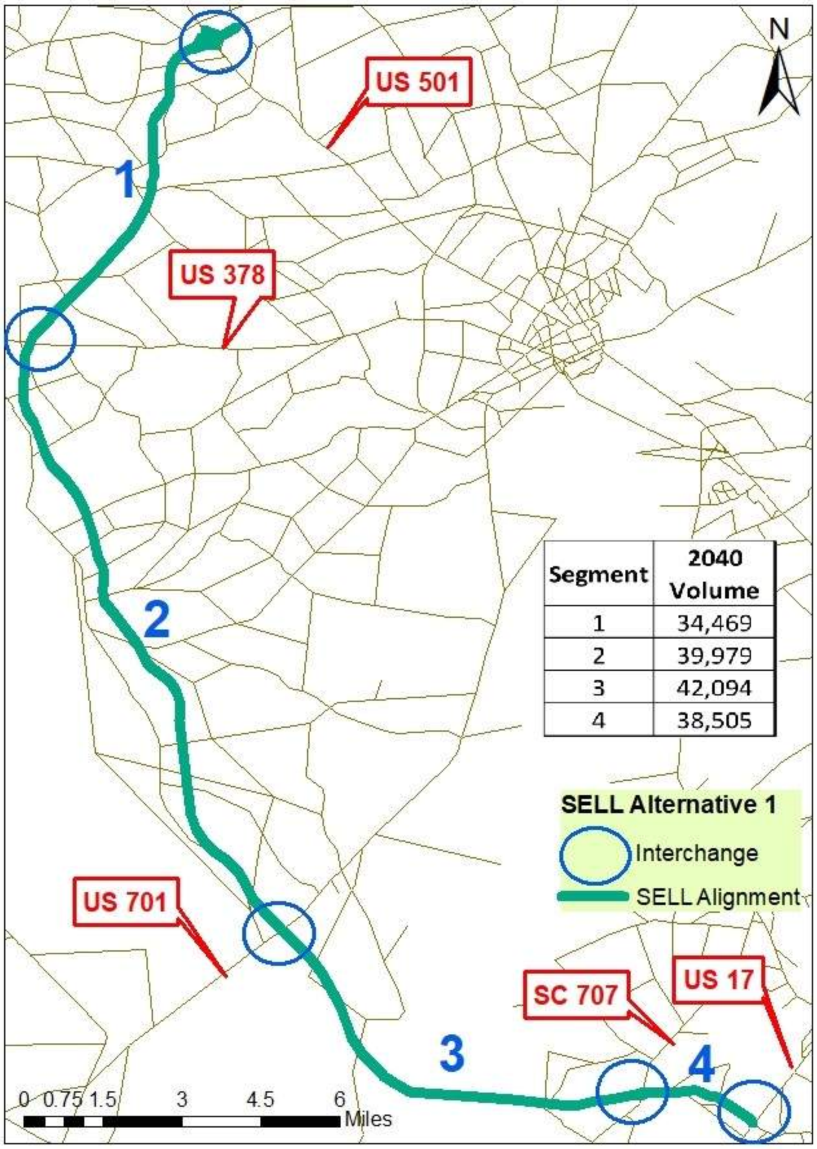


Segment	2040 Volume
1	30,739
2	19,175
3	46,423
4	48,710

Figure 3 - No-Build Alternative

4.1.2 Alternative 1 (GSATS SELL Alternative 1)

Alternative 1 starts at Conway Bypass and US 501 interchange and runs in the southwest direction until intersecting US 378 one mile east of Pee Dee Highway (S-26-24). It continues in the southeast direction until intersecting US 701 1.5 miles west of Little Lamb Road (S-26-48) and then continues in the southeast direction until intersecting SC 707 0.6 miles south of Bay Road (S-26-926). From there it proceeds east until it terminates at the intersection of US 17 and Glenns Bay Road. The total length of Alternative 1 is 29.3 miles. Interchanges are provided along its alignment at US 501, US 378, US 701, SC 707, and US 17. Alternative 1 and the 2040 volume assignments are shown in **Figure 4**.



Segment	2040 Volume
1	34,469
2	39,979
3	42,094
4	38,505

Figure 4 - Alternative 1

4.1.3 Alternative 2 (GSATS SELL Alternative 2)

Alternative 2 follows the same alignment as Alternative 1 except from 0.8 miles west of its intersection with SC 707. At that point, the Alternative 2 alignment continues along a more southern route than Alternative 1 between SC 707 and US 17 where it terminates 0.7 miles southwest of the US 17 and Holmestown Road intersection. The total length of Alternative 2 is 30.4 miles. Interchanges are provided along its alignment at US 501, US 378, US 701, SC 707, and US 17. Alternative 2 and the 2040 volume assignments are shown in **Figure 5**.

2	40,918
3	44,260
4	41,081

Figure 5 - Alternative 2

4.1.4 Alternatives 3 and 5 (GSATS SELL Alternative 3)

The alignments for Alternative 3 and 5 are slightly different. However, the minor differences in the alignments were considered not significant for modeling purposes. Alternative 3 was coded into the network. Alternative 3&5 is used to indicate results for the single modeled alternative for these two similar alternatives. Alternative 3&5 is the same as Alternative 1 from US 501 to just north of where it crosses Four Mile Road (S-26-548). From there, Alternative 3&5 runs generally parallel to the east of Alternative 1, intersecting US 378 approximately three miles east of the Alternative 1 interchange, to approximately where it crosses Harder Road. At this point Alternative 3&5 turns to the southwest until it intersects US 701 about 0.5 miles northeast of Alternative 1. Alternative 3&5 continues south for another 1.7 miles before the alignment follows the remainder of Alternative 1 to its termination point at US 17. Alternative 3&5 is 30.6 miles long and has interchanges at US 501, US 378, US 701, SC 707, and US 17. Alternative 3&5 and the 2040 volume assignments are shown in **Figure 6**.

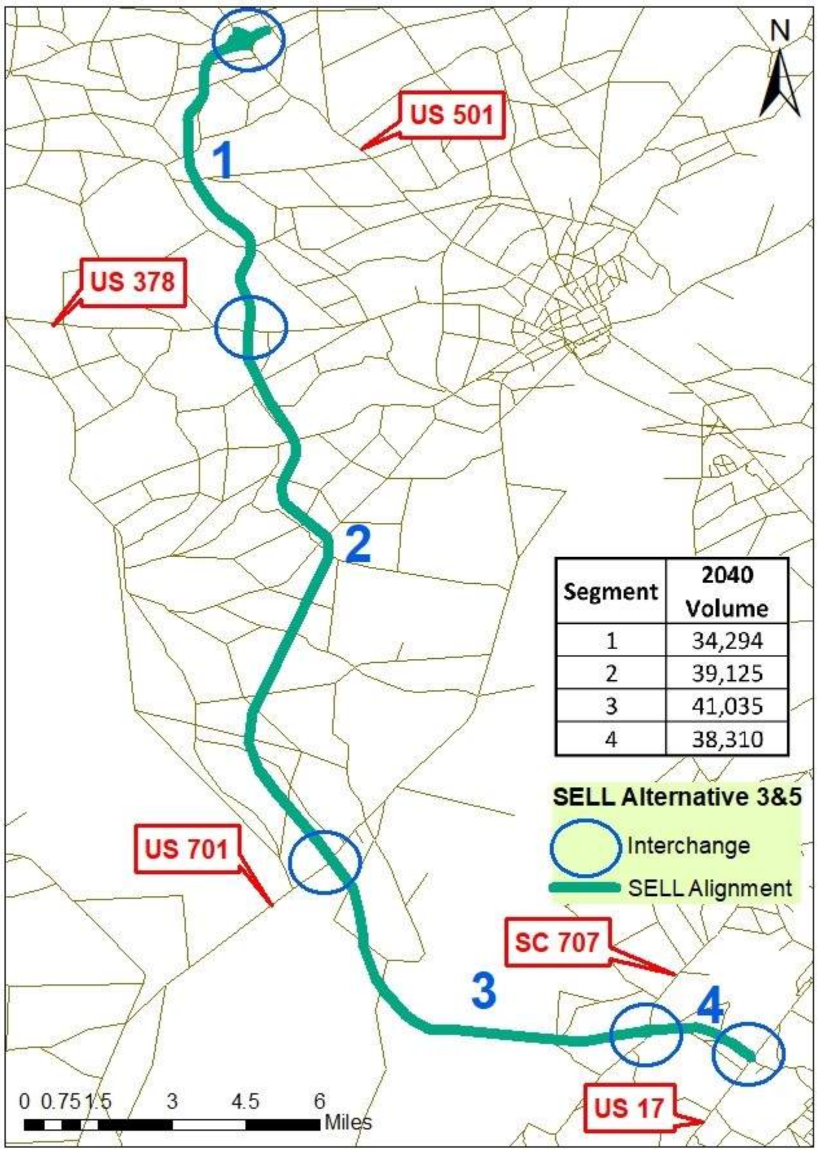

Figure 6 - Alternative 3&5

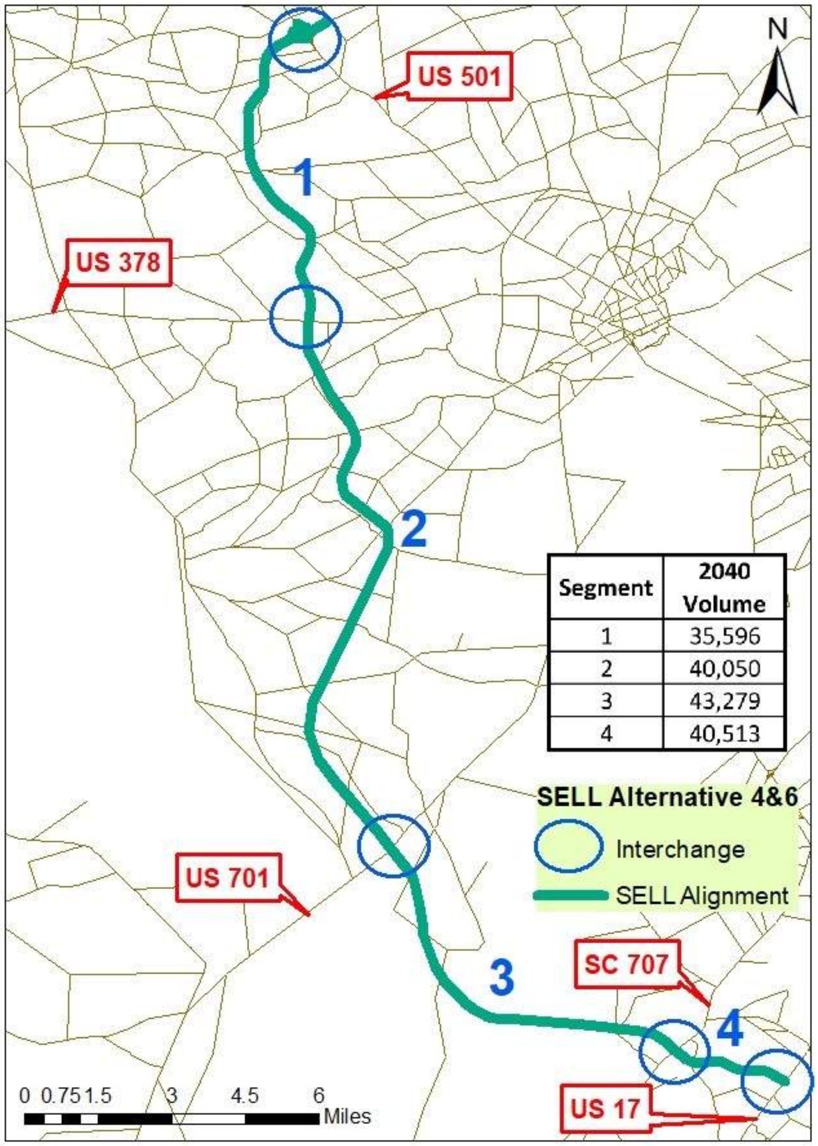
4.1.5 Alternatives 4 and 6 (GSATS SELL Alternative 4)

The alignments for Alternative 4 and 6, similar to the alignments for Alternatives 3 and 5, were close enough to combine them into a single alternative that followed Alternative 4. Alternative 4&6 is used to indicate results for the single modeled alternative for these two similar alternatives. Alternative 4&6 has the same alignment as Alternative 3&5 until approximately 0.8 miles west of SC 707, where Alternative 4&6 follows the alignment of Alternative 1 to its southern terminus. Alternative 4&6 is 30.1 miles long and has interchanges with US 501, US 378, US 701, SC 707, and US 17. Alternative 4&6 and the 2040 volume assignments are shown in **Figure 7**.



Segment	2040 Volume
1	35,596
2	40,050
3	43,279
4	40,513

Figure 7 - Alternative 4&6

4.1.6 Alternative 7 (GSATS SELL Alternative 5)

Alternative 7 follows the alignment of Alternative 3&5 from the beginning until about where it crosses Harder Road. At this point, Alternative 7 proceeds southeast, to its terminus at SC 31. Alternative 7 is 22.8 miles long. It has interchanges at US 501, US 378, US 701, SC 544, and SC 31. Alternative 7 and the 2040 volume assignments are shown in **Figure 8**.

2	41,851
3	67,428
4	46,071

Figure 8 - Alternative 7

4.1.7 Alternatives 8 and 9 (GSATS SELL Alternative 6)

Alternative 8 and Alternative 9 were also two alternatives that were similar enough to combine into a single alternative alignment in the GSATS model, with Alternative 8 coded into the network. Alternative 8&9 is used to indicate results for the single modeled alternative for these two similar alternatives. The first 1.5 miles of Alternative 8&9 is the same as all prior alternatives beginning at the US 501 interchange. Just south of where it crosses Knotty Brand Road, Alternative 8&9 runs southeast then south, generally parallel to Alternative 7, until it intersects Alternative 7 just west of US 701. Alternative 8&9 then coincides with Alternative 7 to their shared terminus at SC 31. Alternative 8&9 is 22.1 miles long. It has interchanges with US 501, US 378, US 701, SC 544, and SC 31. Alternative 8&9 and the 2040 volume assignments are shown in **Figure 9**.

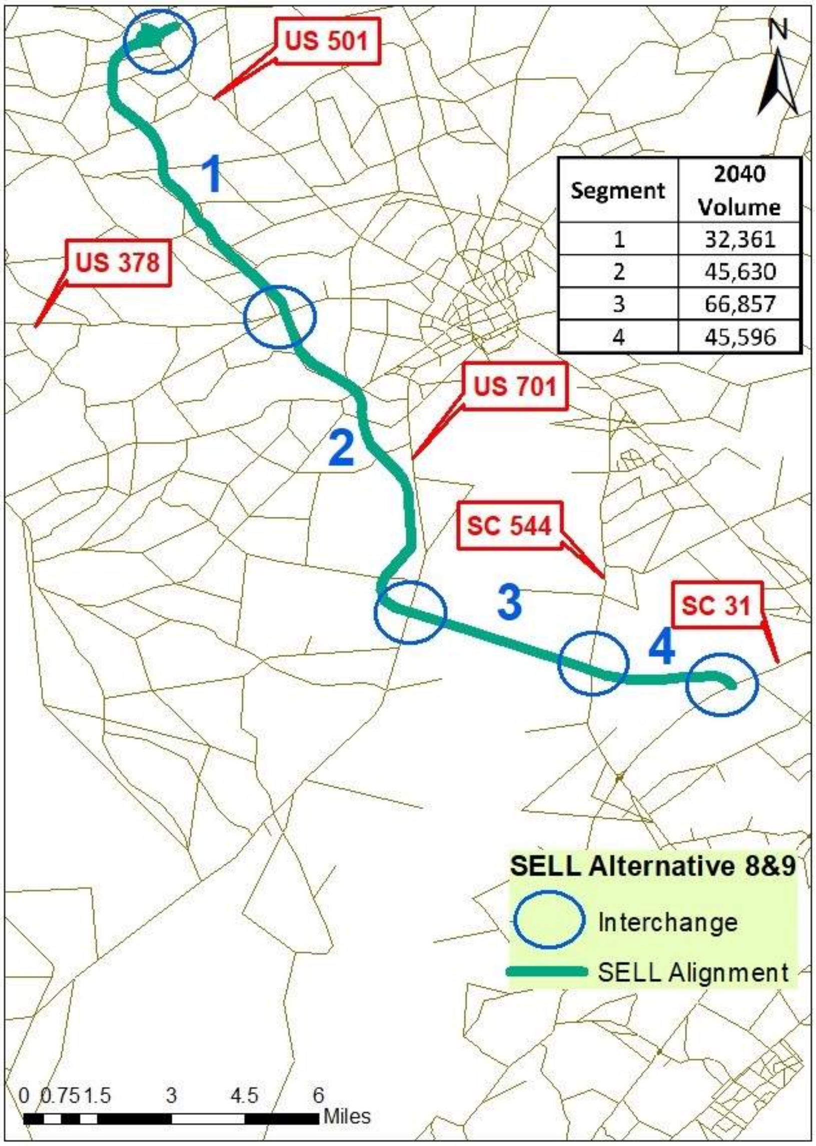

Figure 9 - Alternative 8&9

4.1.8 Alternatives 10 and 11 (GSATS SELL Alternative 7)

Alternative 10 and Alternative 11 also have similar enough alignments so that Alternative 11 was coded as a single alternative in the GSATS model. Alternative 10&11 is used to indicate results for the single modeled alternative for these two similar alternatives. From the US 501 interchange with SC 22, Alternatives 10&11 coincides with Alternatives 8&9 to a point north of Harder Road and west of US 701. At that point, Alternatives 10&11 continues southwest for about 6.5 miles, where it coincides with Alternative 3&5, continuing along the same alignment to its terminus at US 17. Alternative 10&11 is 31.4 miles long. It has interchanges with US 501, US 378, US 701, SC 707, and US 17. Alternative 10&11 and the 2040 volume assignments are shown in **Figure 10**.

3	38,803
4	37,757

Figure 10 - Alternative 10&11

4.1.9 Alternatives 12 and 13 (GSATS SELL Alternative 8)

Alternative 12 and Alternative 13 also have similar enough alignments so that Alternative 13 was coded to represent both alignments in the GSATS model. Alternative 12&13 is used to indicate results for the single modeled alternative for these two similar alternatives. Alternative 12&13 follows the same alignment as Alternative 10&11 at a point starting 0.8 miles west of SC 707 where it follows the common alignment of Alternatives 2 and 4&6 to its terminus at US 17. Alternative 12&13 is 31.2 miles long. It has interchanges at US 501, US 378, US 701, SC 707, and US 17. Alternative 12&13 and the 2040 volume assignments are shown in **Figure 11**.

3	41,309
4	39,647

Figure 11 - Alternative 12&13

4.1.10 Alternative 14 (GSATS SELL Alternative 9)

Alternative 14 begins on US 501 at the interchange with SC 22 (Conway Bypass). Alternative 14 runs along a widened existing alignment of US 501 to the southeast for 5.4 miles. At this point, Alternative 14 runs along the widened existing alignment of El Bethel Road to Cates Bay Highway at which point it continues along the widened alignment of the Conway Perimeter Road to US 701. Alternative 14 runs along new alignment between US 701 and SC 544. Alternative 14 then follows a widened existing alignment of SC 544 for about 10.4 miles to its terminus at US 17. Alternative 14 is 24.1 miles long and is expected to have multiple at grade intersections throughout its length. Alternative 14 and the 2040 volume assignments are shown in **Figure 12**.

5	67,519
6	63,989

Figure 12 - Alternative 14

4.1.11 Alternative 15 (GSATS SELL Alternative 10)

Alternative 15 follows the same alignment as Alternative 14 between the SC 22 interchange and US 701. From that point, Alternative 15 follows a portion of the new alignment from Alternative 14 for about 1.4 miles to the southeast, and then bends to the north to intersect US 501 following the general alignment of the Academy Drive Extension. Alternative 15 then continues to the east along a widened existing alignment of US 501, then to the south along a widened existing alignment of SC 544 to its terminus at US 17. Alternative 15 is 26 miles long and is expected to have multiple at grade intersections throughout its length. Alternative 15 and the 2040 volume assignments are shown in **Figure 13**.

Figure 13 - Alternative 15

4.1.12 Alternative 16 (GSATS SELL Alternative 11)

Alternative 16 begins on US 501 at the SC 22 interchange, then follows widened existing alignment along US 501 to the southeast direction before turning to the south on widened existing alignment along SC 544 to its terminus at US 17. Alternative 16 is 23.8 miles long and is expected to have multiple at grade intersections throughout its length. Alternative 16 and the 2040 volume assignments are shown in **Figure 14**.

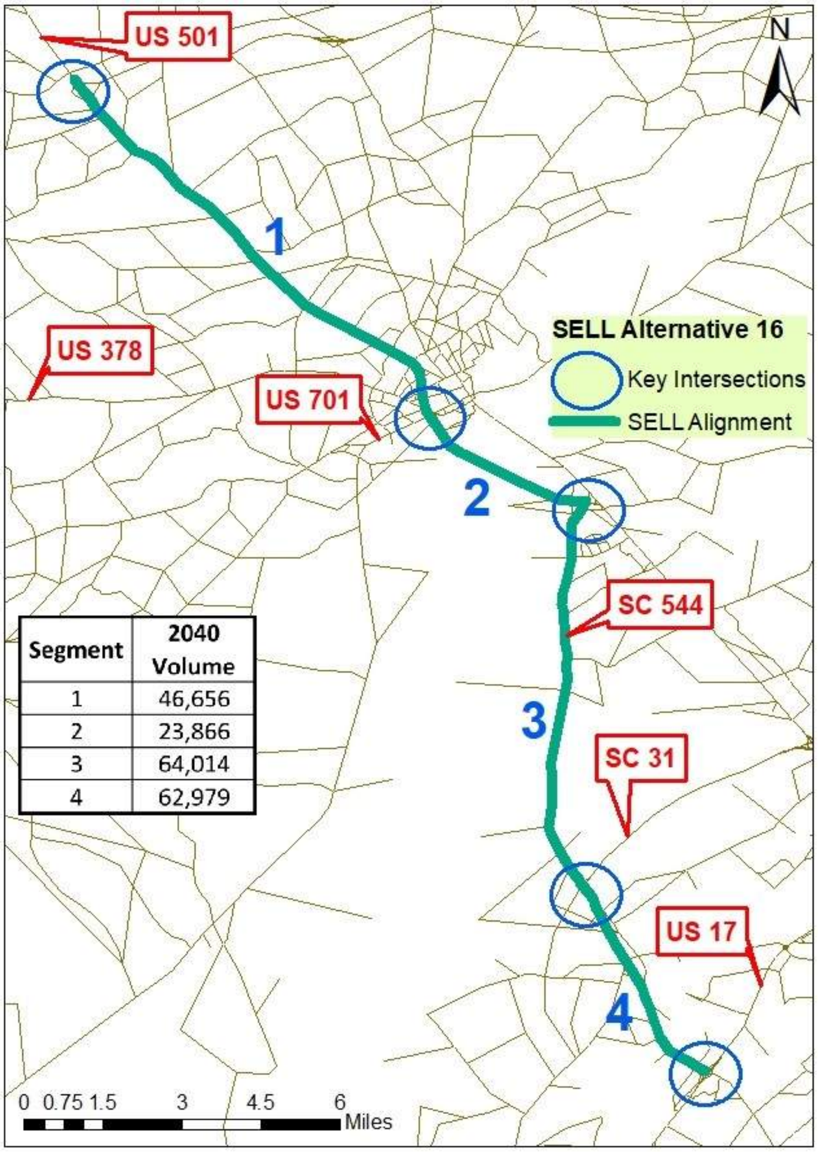

Figure 14 - Alternative 16

5 GSATS Traffic Assignment Results

The No-Build and eleven future year 2040 GSATS SELL Alternatives, made up of the original 16 roadway alternatives, were run in the GSATS model. A range of output files were generated by the model for each run, including daily and peak period traffic volumes and intersection flows. The selected SELL segment daily volumes shown in the tables in **Figure 3** through **Figure 14** were obtained from these traffic assignments. More detailed volume figures of the GSATS network links within the SELL study area are presented in the following pages.

Intersection flows at the proposed SELL interchange locations and for a few selected arterial intersections were produced. While the accuracy of the intersection flow generated by travel demand models is limited, they can be useful in developing the preliminary size and configuration of proposed interchanges, as well as provide insight into the number of turn lanes that might be needed at ramp termini and at intersection locations. Summaries of the intersection flows are contained in **Appendix A**.

A summary of the daily link volumes for the No-Build and SELL Alternatives were incorporated into a spreadsheet to allow for comparisons of the traffic assignments for selected links in each alternative. These daily link volumes are contained in **Appendix B**.

6 Measures of Effectiveness of the Developed Alternatives

Measures of effectiveness (MOE) were obtained from the GSATS model runs for the 2040 E+C Network (No-Build) condition and for the SELL alternatives. These measures of effectiveness include:

- Vehicle-Miles Traveled (VMT) – VMT is calculated by multiplying the length of a roadway link, in miles, by the volume on a roadway link during a specific time period.
- Vehicle-Hours Traveled (VHT) – VHT is calculated by multiplying the estimated time, in hours, to travel through a roadway link by the vehicles on the roadway link during a specific time period.
- Free Flow Travel Time – The Free Flow Travel Time for each link is calculated by the model for each link based on the link length and the coded posted speed limit for that link converted from miles per hour to miles per minute. The resulting free flow travel time for each link is reported in minutes. The free flow travel time on each link is directional; however, since the coded posted speed limit and the link length are identical for each direction on the link, the directional free flow travel times will be identical.
- Estimated Travel Time – The GSATS model estimates congested speeds for each network link during the iterative traffic assignment. The congested speeds from the final assignment iteration are converted and reported for each link as estimated travel times (in minutes) for each period (AM peak, PM peak, Off-peak, and Daily). The estimated travel time on each link is directional. During the different peak periods, the estimated travel time in one direction on a link may be higher or lower than the estimated travel time in the opposite direction on the same link based on the time of day distribution of traffic.
- Average Speed – Average speed, in miles per hour, is estimated by dividing the Estimated Congested Travel Time for a collection of links by the total length of the links within the GSATS model. Due to the way the network links are created in TransCAD, the length of the links within the GSATS model will likely vary from actual link lengths in the field or as developed in MicroStation.
- Volume-Capacity ratio (V/C) – The V/C is calculated by the model for each link based on the traffic assignment volume divided by the theoretical link capacity. The link capacity in the GSATS model is based on the coded functional classification and the number of lanes on each link. The lower the value of the V/C, the less congested a link is likely to be. In general, a V/C less than 1.0 would be considered operating 'under-capacity'. A V/C equal to 1.0 indicates that the traffic assignment volume is equal to the link capacity; this link would be considered operating 'at capacity'. A V/C greater than 1.0 indicates the link is predicted to carry more traffic than the capacity of the link; this link would be considered 'over-capacity'.
- Level of Service (LOS) – LOS is used to represent the amount of congestion occurring on a network link. In the GSATS model, LOS is based on the V/C ratio. Six letters are used to summarize a range of V/C ratios, with LOS A indicating the lowest range of V/C ratios and the least congested links, with LOS F indicating the highest range of V/C ratios and the most congested links.

These MOE are generated by the GSATS model for each link in the network, except for the Average Speed, which is calculated from the link length and the Estimated Congested travel time. MOE are generated by the GSATS model for the AM peak period (6-9 AM), PM peak period (3-6 PM) and off-peak periods (all other others) and are aggregated into Daily MOE, which are either the sum (such as for VMT and VHT) or the average (such as for travel time) of the peak period MOE.

In addition to these MOE, a set of travel time maps depicting the congested peak hour travel time for each SELL alternative in five-minute increments were prepared. Turning movements predicted by the model at interchanges and selected intersections were also developed from the model outputs.

The MOE described in this section generally are limited to the eight new alignment SELL alternatives and the existing arterial routes that make up portions of the three alternatives that incorporate the existing arterial roadways of SC 544 between US 17 and US 501, El Bethel Road/Conway Perimeter Road, and/or US 501 between SC 544 and the SC 22 Interchange. MOE were selected for other network links, such as those with interchanges to the new SELL alignments or the arterial roadways used in the SELL alignments.

MOE outside of these network links throughout the rest of the GSATS model area were not included. Their exclusion was to avoid numerically overwhelming the MOE for the specific alternatives and arterial roadway links.

Most of the MOE (VMT, VHT, Travel Time, Travel Speed) can be combined to generate an aggregated MOE for a series of links making up the SELL alternative. LOS and V/C cannot be aggregated and are summarized in figures depicting the V/C adjacent to links color-coded to represent the corresponding LOS.

6.1 MOE Summary

Table 2 and **Table 3** include summaries of the 2040 Daily MOE for the various SELL alternatives as well as the arterial roadway sections along SC 544, US 501, and El Bethel Road/Conway Perimeter Road. Select roadway segments were identified for comparison purposes across the alternatives. The following Daily MOE are shown in the tables:

- Minimum Link Volume: the minimum link volume occurring on the roadway segments for only the 11 SELL Alternatives and the No-Build alternative (using the same links as Alternative 16/SELL 11).
- Maximum Link Volume: the maximum link volume occurring on the roadway segments for only the 11 SELL Alternatives and the No-Build alternative (using the same links as Alternative 16/SELL 11)
- Average Link Volume: the numeric average of the link volumes occurring on the roadway segments for only the 11 SELL Alternatives and the No-Build Alternative (using the same links as Alternative 16/SELL 11).
- VMT: the sum of the VMT for each link with the roadway sections.
- VHT: the sum of the VHT for each link within the roadway sections.
- Freeflow Time: the sum of the freeflow travel time for each link within the roadway sections.
- TIME: the sum of the estimated travel time for each link within the roadway section. In **Table 2** and **Table 3**, the Average Daily Travel Time is shown.
- Total Distance: the sum of the coded link distances within the roadway section.
- Average Speed: the calculated average speed across the roadway section derived from the TIME and Total Distance.

The first block of rows in Table 2 summarize the MOE for the SELL Alternative links, labeled ‘SELL’ in the column headed with ‘Segments’. The 2040 No-Build results use the same links as in Alternative 16/SELL 11 but without widening coded for that alternative.

In all subsequent blocks of rows in Tables 2 and 3, the MOE are summarized for those groups of segments in the No-Build and the SELL alternatives. This permits a comparison of how the MOE for the various groups of segments change compared to the no-build alternative as a result of the implementation of the individual SELL alternatives. These segments generally are not part of the individual SELL alternatives, except in the areas highlighted yellow. Where yellow highlights occur, the group of segments are widened as part of that specific SELL alternative.

Highlighted areas indicate the roadway segments that would be widened in the alternative.

In **Table 2**, the values shown in **bold blue text** for the SELL alternative in the 'SELL_NB' column represent the 2040 No-Build MOE for the existing arterial segments (shown in **Figure 15**) that, when widened, make up SELL Alternative 16 (shown in **Figure 26**). These values were included to provide a basis for comparison of the No-Build condition to the SELL Alternatives (14-16) that make use of existing arterial roadways for most or all the three SELL alternatives. These values should not be compared to the MOE for SELL Alternatives 1-13. The existing segments which are widened in SELL Alternatives 14-16 are highlighted in **Table 2** and **Table 3**.

Several SELL segments are used to denote a terminus of an existing arterial roadway section. The general location of these SELL segments in relation to the existing roadway network is as follows:

- SELL Segment O (at SC 544) – between Buccaneers Cove and Hillcrest Cemetery
- SELL Segment M (at US 501) – approximately at the location of Academy Drive.
- SELL Segment K (extension of Conway Perimeter Road/Segment H) – between US 701 and Segments O an M.

The location of segments O, M, and K and their proximity to SC 544 and US 501 are shown in **Figure 27**.

The two SC 544 segments between US 17 and the location of SELL Segment W, and between the location of SELL Segment W and SELL Segment O are widened in Alternatives 14-16 (SELL 9-11). The SC 544 segment from the location of SELL Segment O to US 501, and the US 501 segment from SC 544 to the location of SELL Segment M are widened in Alternatives 15 and 16 (SELL 10 and 11), but not in Alternative 14 (SELL 9). Only Alternative 16 (SELL 11) uses US 501 between SELL Segment M, past US 378 to El Bethel Road; in this area, Alternatives 14 and 15 (SELL 9 and 10) run on new alignment and make use of the Conway Perimeter Road/El Bethel Road instead of US 501. All three alternatives make use of US 501 from El Bethel Road to the SC 22 interchange.

6.1.1 Average Daily Volume

Of the new alignment SELL alternatives shown in **Table 2**, the average volume on the new alignment SELL alternatives are estimated to range from approximately 32,700 vehicles per day for Alternatives 3&5 (GSATS model Alternative 3) to approximately 45,100 vehicles per day for Alternatives 8&9 (GSATS model Alternative 6).

The three alignments (Alternatives 14-16) making use of most or all of SC 544, Conway Perimeter Road, and US 501 are projected to carry an average volume of between approximately 50,300 and 52,500 vehicles per day.

As mentioned previously, the tables summarizing the total flow along the individual selected SELL study area links are contained in **Appendix B**.

6.1.2 Vehicle-Miles Traveled

As shown in **Table 2**, Alternatives 1-6 have the highest VMT of the new alignment SELL alternatives. The VMT for these alternatives range from about 1.02 million VMT (Alternatives 3&5) to about 1.13 million VMT for Alternative 2. Alternative 8&9 and Alternative 7 have the lowest VMT of the new alignment alternatives (about 877,000 and 906,000 VMT) respectively). These alternatives are the two new alignment alternatives that begin on SC 31 between US 501 and SC 544 and have the shortest total length (about 19.6 and 20.3 miles respectively). The segment between SC 544 and US 701 in these alternatives also carry the highest total daily volume of any of the new alignment segments (66,900 vpd and 67,500 vpd respectively).

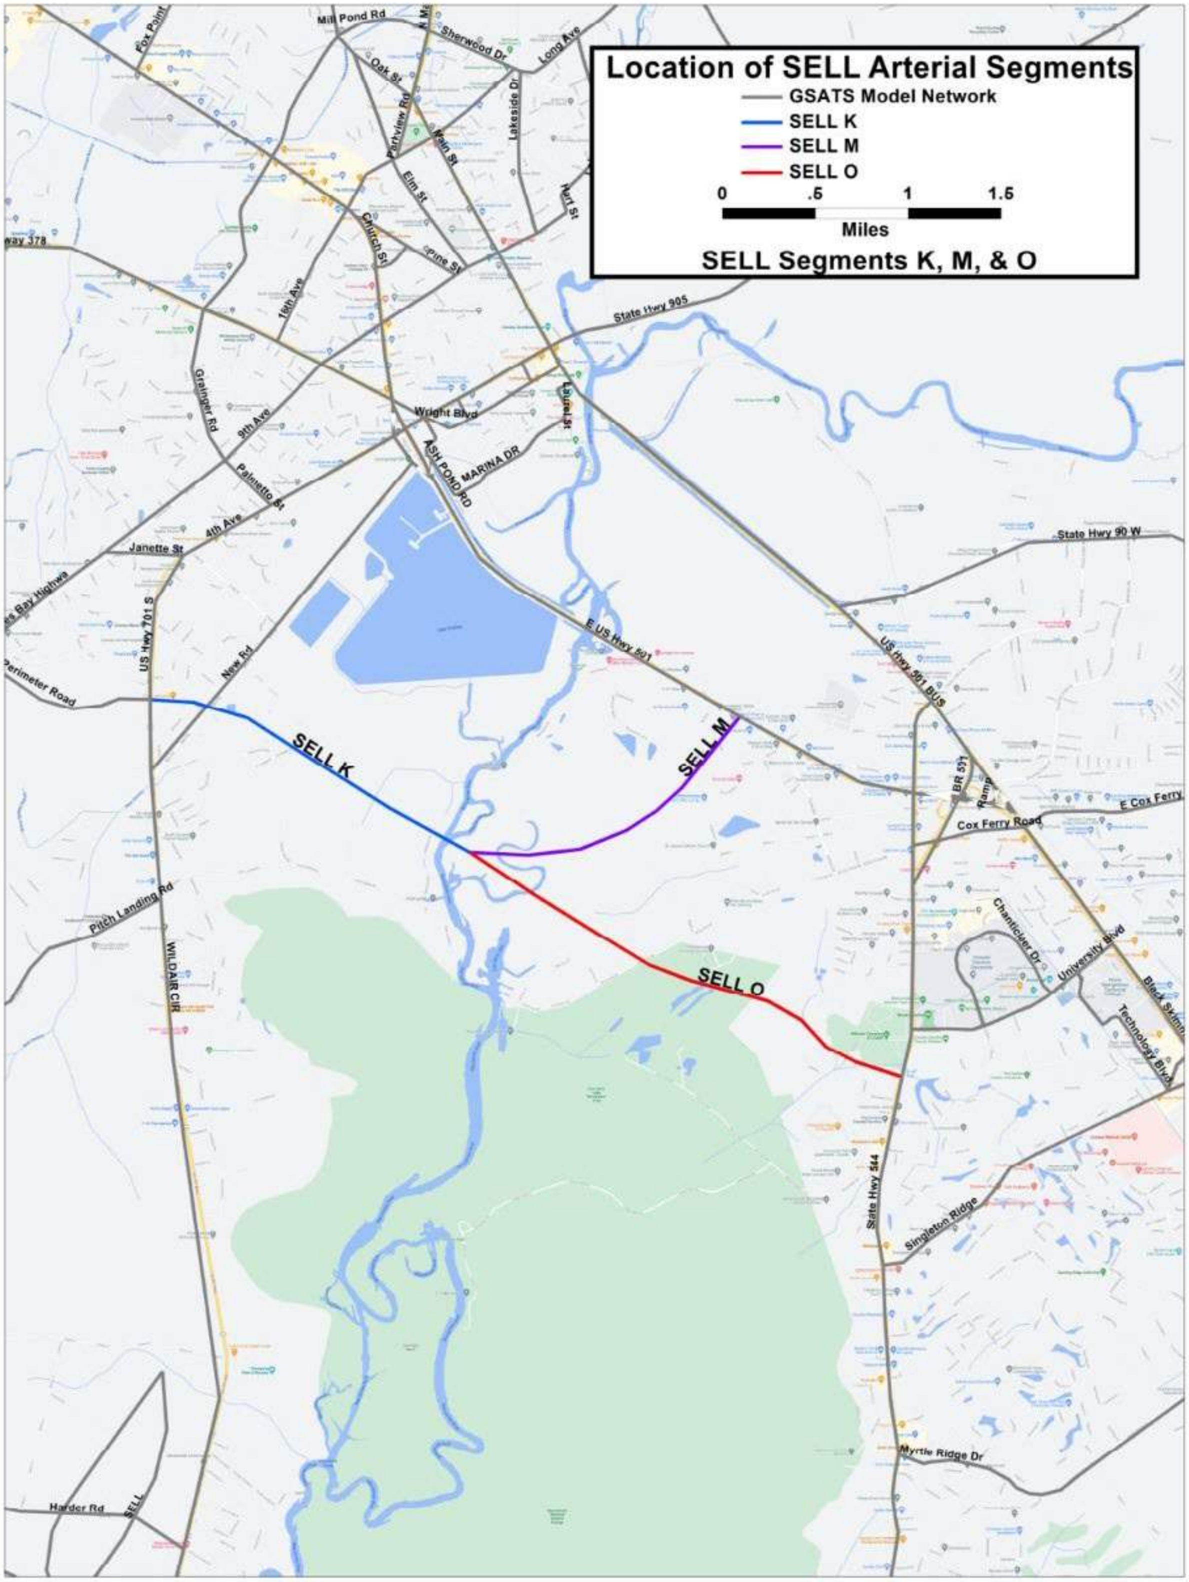

Figure 27 - Location of SELL Segments K, M, and O

The VMT for Alternatives 14-16 are slightly higher than the highest new alignment VMT (Alternative 2 – 1.13 million VMT). The VMT for the three alternatives range from about 1.18 million VMT to 1.22 million VMT.

The tables summarizing the VMT along the individual selected SELL study area links are contained in **Appendix C**.

6.1.3 Vehicle-Hours Traveled

As shown in **Table 2**, Alternatives 1 and 2 have the highest VHT of the new alignment SELL alternatives. The VHT for these alternatives are approximately 18,500 VHT. The lowest VHT of the new alignment alternatives is around 15,400 VHT for alternatives 10&11 and 12&13.

The VHT for Alternatives 14-16 are substantially higher than those of the new alignment alternatives. Many of the arterial segments in the no-build condition carry more traffic than the new alignment SELL alternative segments. With the additional capacity provided along the arterials in Alternatives 14-16, additional traffic (generally between 10,000 to 27,000 vehicles) will be drawn to the arterial segments, though this additional traffic is generally less than the traffic drawn to the new alignment SELL links (generally between 30,000 and 46,000). The high volume of traffic on the arterial links, coupled with lower average speeds and higher travel times result in the range of VHT for Alternatives 14-16 to range from about 39,300 (Alternative 14) to about 53,600 (Alternative 16).

The tables summarizing the VHT along the individual selected SELL study area links are contained in **Appendix D**.

Table 4 summarizes the total VMT and VHT for the No-Build and 11 SELL Alternatives for the portion of the GSATS model network links within the SELL study area boundary shown in **Figure 2**.

Table 4 - SELL Alternative VMT-VHT Summary

SELL ALTERNATIVE	Total VMT	Change	% Change	Total VHT	Change	% Change
No-Build	7,431,890.16	-	-	451,281.23	-	-
ALT 1 (SELL_01)	8,138,480.22	706,590.06	9.51%	434,944.73	(16,336.50)	-3.62%
ALT 2 (SELL_02)	8,176,697.18	744,807.02	10.02%	431,393.34	(19,887.89)	-4.41%
ALT 3&5 (SELL_03)	8,129,155.64	697,265.48	9.38%	432,715.77	(18,565.46)	-4.11%
ALT 4&6 (SELL_04)	8,168,722.50	736,832.33	9.91%	429,415.59	(21,865.64)	-4.85%
ALT 7 (SELL_05)	8,218,368.37	786,478.21	10.58%	442,418.83	(8,862.39)	-1.96%
ALT 8&9 (SELL_06)	8,185,788.65	753,898.49	10.14%	440,050.19	(11,231.04)	-2.49%
ALT 10&11 (SELL_07)	8,102,515.71	670,625.54	9.02%	431,026.45	(20,254.78)	-4.49%
ALT 12&13 (SELL_08)	8,148,362.45	716,472.28	9.64%	428,283.67	(22,997.56)	-5.10%
ALT 14 (SELL_09)	7,909,851.89	477,961.72	6.43%	430,039.16	(21,242.07)	-4.71%
ALT 15 (SELL_10)	7,856,755.51	424,865.34	5.72%	437,355.47	(13,925.75)	-3.09%
ALT 16 (SELL_11)	7,753,702.55	321,812.38	4.33%	443,334.00	(7,947.23)	-1.76%

The eight new alignment SELL alternatives result in an estimated increase in VMT of between 9.0 and 10.6 percent compared to the no-build alternative. The three alternatives that make use of improvements along the existing arterials of SC 544 and US 501 have lower estimated increases in VMT ranging between 4.3 and 6.4 percent. The eight new alignment SELL alternatives are estimated to result in a reduction of VHT of between approximately 1.9

and 5.1 percent. The three alternatives that make use of SC 544 and US 501 are estimated to result in a reduction of VHT between 1.7 and 4.7 percent.

Alternative 14 (SELL 09) has the third highest estimated reduction in VHT, with greater reductions estimated for Alternatives 12&13 (SELL 08) and Alternatives 4&6 (SELL 04).

6.1.4 Travel Time

Two travel times generated by the GSATS model were evaluated. The Freeflow Travel Time is the estimated travel time based on individual link length and coded speed limit. The Average Daily Travel Time is calculated for each link as a result of the model performing the iterative traffic assignment during each alternative model run. As mentioned previously, the GSATS model estimates congested speeds and converts those to estimated travel times for each direction on each link for the AM peak, PM peak, and Off-Peak periods. These are then aggregated and averaged to produce an Average Daily Travel Time. The Average Daily Travel Time will generally differ from the Freeflow Travel Time in that it will increase as traffic volumes increase. The bigger the increase in the Average Daily Travel Time compared to the Freeflow Travel Time indicates more traffic and more congestion.

As shown in **Table 2**, for the new alignment alternatives, the shortest alternatives (Alternatives 7 and 8&9) have the lowest Freeflow Travel Time (between 18.1 and 18.8 minutes). The remaining new alignment alternatives have Freeflow Travel Times ranging from 23.3 to 26.7 minutes.

Alternatives 7 and 8&9 also have the lowest Average Daily Travel Time (24.5 and 23.9 minutes respectively) of the new alignment alternatives shown in **Table 2**. Alternative 12&13 has the next lowest Average Daily Travel Time (about 26.9 minutes). The remaining alternatives have Average Daily Travel Times ranging between 29.3 and 32.7 minutes.

Alternative 12&13, Alternative 4&6 and Alternative 2 have the least difference between the Freeflow Travel Time with the Average Daily Travel Time shown in **Table 2**. The Average Daily Travel Time for Alternative 12&13 increases by about 3.2 minutes compared to the Freeflow Travel Time. The Average Daily Travel Time for Alternative 4&6 and Alternative 2 are estimated exceed the Freeflow Travel Time by about 4.2 and 4.4 minutes. The biggest difference between the Freeflow Travel Time and the Average Daily Travel Time is about six minutes (Alternative 1).

There is a much bigger difference between the Freeflow Travel Time and the Average Daily Travel Time for Alternatives 14-16 as shown in **Table 2**. While these alternatives, which take place mostly or entirely on expanded existing arterial roadways, have Freeflow Travel Times between about 23 and 25 minutes, the Average Daily Travel Times range between 64 and 86 minutes. This is largely due to the much higher volume of traffic and higher levels of congestion on these alternatives.

The tables summarizing the Freeflow Travel Time and Average Daily Travel Time along the individual selected SELL study area links are contained in **Appendix E** and **Appendix F** respectively.

Average Speed

The GSATS model estimates individual directional link speeds for the AM, PM, and off-peak periods, but does not provide link speed estimates for the daily traffic.

Unlike the other MOE, total speed along an alignment or section of an alignment is not additive, like VMT, VHT or Travel Time. And because the individual links are of varying lengths, a simple average (the sum of the speeds divided by the number of links) cannot be used to determine an overall average speed. A weighted average using link speeds and link lengths might be used to estimate the average speed along an alignment or alignment section. However, an efficient method to estimate the average speed for an alignment is to divide the total alignment length by the total Daily Travel Time and convert the quotient to mile per hour. This is how the average speed shown for the alignments in **Tables 2 and 3** were derived.

Alternative 12&13 had the highest average speed (about 60 mph) of the new alignment alternatives. Three other alternatives (Alternatives 2, 4&6, and 10&11) had average speeds of about 55 mph. Alternatives 1 and 3&5 had average speeds of about 52 mph. The new alignment alternatives with the lowest average speeds were Alternatives 7 and 8&9, which were just below 50 mph.

The average speeds for the three alternatives (Alternatives 14-16), which are mostly or all improved existing arterial roadways, had substantially lower average speeds (between 16 and 19 mph). This is generally 30-40 mph lower than the new alignment average speeds.

6.1.5 Volume-Capacity Ratio and LOS

Similar to average speed, an average V/C ratio or LOS for an entire alignment or alignment section is not easily derived. The SCDOT Planning LOS criteria establishes a V/C of 1.0, which is typically the threshold between LOS E and LOS F, as the threshold between LOS C and LOS D. This results in roadway segments in the GSATS model being classified at LOS D (which is defined in the GSATS model as a V/C ratio of 1.0 to 1.15) when they are actually over-capacity and would normally be classified as LOS F. For this analysis, a more typical range of V/C were used to establish LOS in the SELL Alternative results rather than using the more liberal SCDOT Planning LOS criteria. The Typical V/C thresholds for LOS and the GSATS (SCDOT Planning) LOS thresholds are shown in **Table 5**.

The various LOS ratings can be described as follows:

- LOS A: Free flow conditions with low traffic volumes traveling at free flow speeds with unimpeded maneuverability
- LOS B: Nearly free flow conditions with traffic generally moving at free flow speeds with slightly impeded maneuverability
- LOS C: Stable flow at or near free flow speeds; increased traffic density begins to restrict maneuverability
- LOS D: Approaching unstable flow conditions with limited maneuverability
- LOS E: Unstable flow moving at slower speeds with very limited or no maneuverability; traffic volumes are approaching roadway capacity
- LOS F: Flow is unstable and slow-moving with frequent stops and traffic back-ups; traffic demand exceeds roadway capacity.

Table 5 - Typical and GSATS Model LOS

LOS	Typical V/C Ratio	GSATS V/C Ratio
A	≤ 0.30	n/a
B	0.30 ≤ 0.50	≤ 0.50
C	0.50 ≤ 0.70	0.50 ≤ 1.00
D	0.70 ≤ 0.84	1.00 ≤ 1.15
E	0.84 ≤ 1.00	1.15 ≤ 1.35
F	> 1.00	> 1.35

Table 6 and **Table 7** depict the minimum and maximum V/C ratios and their corresponding 'Typical' LOS for the same segments shown in **Table 2** and **Table 3**. The SELL Alignment LOS are separated into the new alignment segments and segments where a proposed SELL alternative incorporates existing arterial roadways. For example, Alternatives 1, 3&5, and 10&11 make use of Holmestown Road, while Alternatives 14-16 make use of various segments of SC 544, US 501 and/or Conway Perimeter Road.

Table 6 - SELL and SC 544 Minimum and Maximum V/C and LOS

Plots of the 2040 No-Build and the SELL Alternatives depicting the Typical V/C ratio and corresponding LOS are included in **Figures 27 to 38**. It should be noted that the SCDOT Planning LOS criteria, which are incorporated into the GSATS model, were not used in these figures. The LOS results in **Appendix I** make use of the SCDOT/GSATS Planning LOS thresholds for the Daily LOS shown in **Appendix H**. **Appendix G** shows the Peak V/C.

6.2 MOE Summary

6.2.1 2040 E+C (No-Build) V/C and LOS

The 2040 E+C (No-Build) V/C and LOS results are shown in **Figure 28**. The no-build alternative does not include any new alignment SELL routes. The existing major arterial routes are all predicted to be generally over-capacity. The LOS for various key arterial routes in the SELL study area are as follows:

- The segment LOS along SC 544 between US 17 and US 501 are generally predicted to operate at LOS F except for a few very short links within the interchange with SC 31.
- US 501 is generally expected to operate at or over capacity (LOS E or LOS F) between SC 544 and the US 22 interchange.
- El Bethel Road between US 378 and US 501 is expected to operate between LOS B and LOS D.
- Holmestown Road between SC 707 and US 17 Bypass is expected to operate between LOS D and LOS F.

Other roadway segments projected to operate at LOS E or LOS F along multiple segments in the SELL study area within the 2040 E+C No-Build network include:

- US 701
- US 378
- SC 707
- US 17 Bypass

6.2.2 Alternative 1 (GSATS SELL Alternative 1)

The Alternative 1 V/C and LOS results are shown in **Figure 29**. Alternative 1 includes new alignment between SC 707 and the US 22 interchange at US 501 and includes a portion of existing Holmestown Road between SC 707 and US 17 Bypass. With a six-lane facility, Alternative 1 is projected to operate between LOS B and LOS C in 2040. As part of Alternative 1, Holmestown Road would also be anticipated to be improved to provide two additional through lanes and is anticipated to operate between LOS D and LOS F between SC 707 and US 17 Bypass.

The LOS for key arterial routes in the SELL study area are as follows:

- SC 544 between US 17 and US 501 is predicted to continue to generally operate at LOS E or LOS F, but is expected to experience slightly reduced V/C as a result of a shift in traffic to Alternative 1. The maximum V/C along the corridor north of SC 31 is projected to be reduced from 1.38 to 1.16.
- US 501 is generally expected to operate at LOS E or LOS F between SC 544 and the US 22 interchange. As a result of Alternative 1, there is a general 10 percent reduction in V/C throughout most of the corridor.
- El Bethel Road/Conway Perimeter Road between US 701 and US 501 is expected to see a reduction in traffic and is estimated to operate at LOS B or better.

Other roadway segments see improvement over the no-build condition resulting from traffic shifting to Alternative 1. Except for portions of the roadways adjacent to the proposed interchanges at US 701, and US 378, traffic on these routes generally is expected to improve to operate at LOS D or better, with some segments operating at LOS E approaching the Conway Perimeter Road. Near the southern terminus of Alternative 1, traffic is expected to increase slightly on SC 707 and US 17 Bypass. Both roads are expected to operate at LOS F, comparable to the No-Build condition.

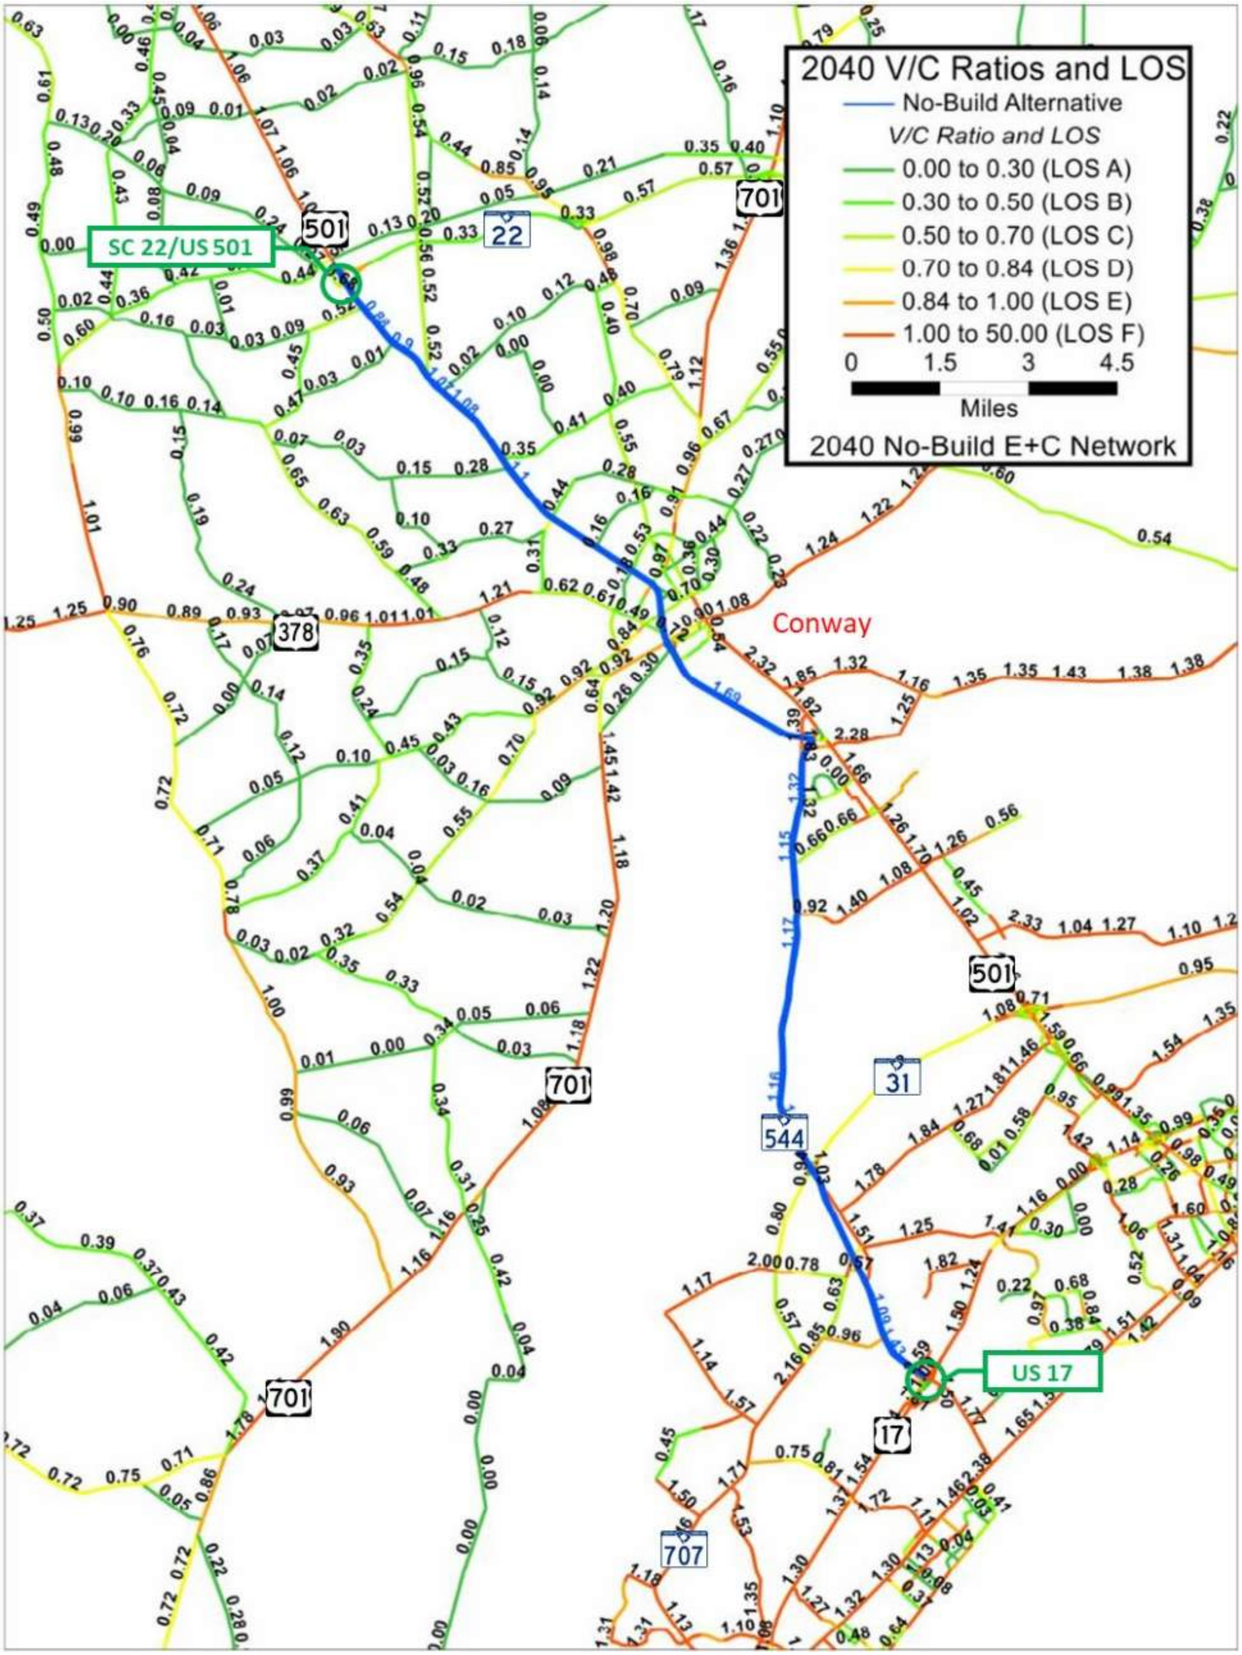

Figure 28 - 2040 E+C (No-Build) V/C and LOS

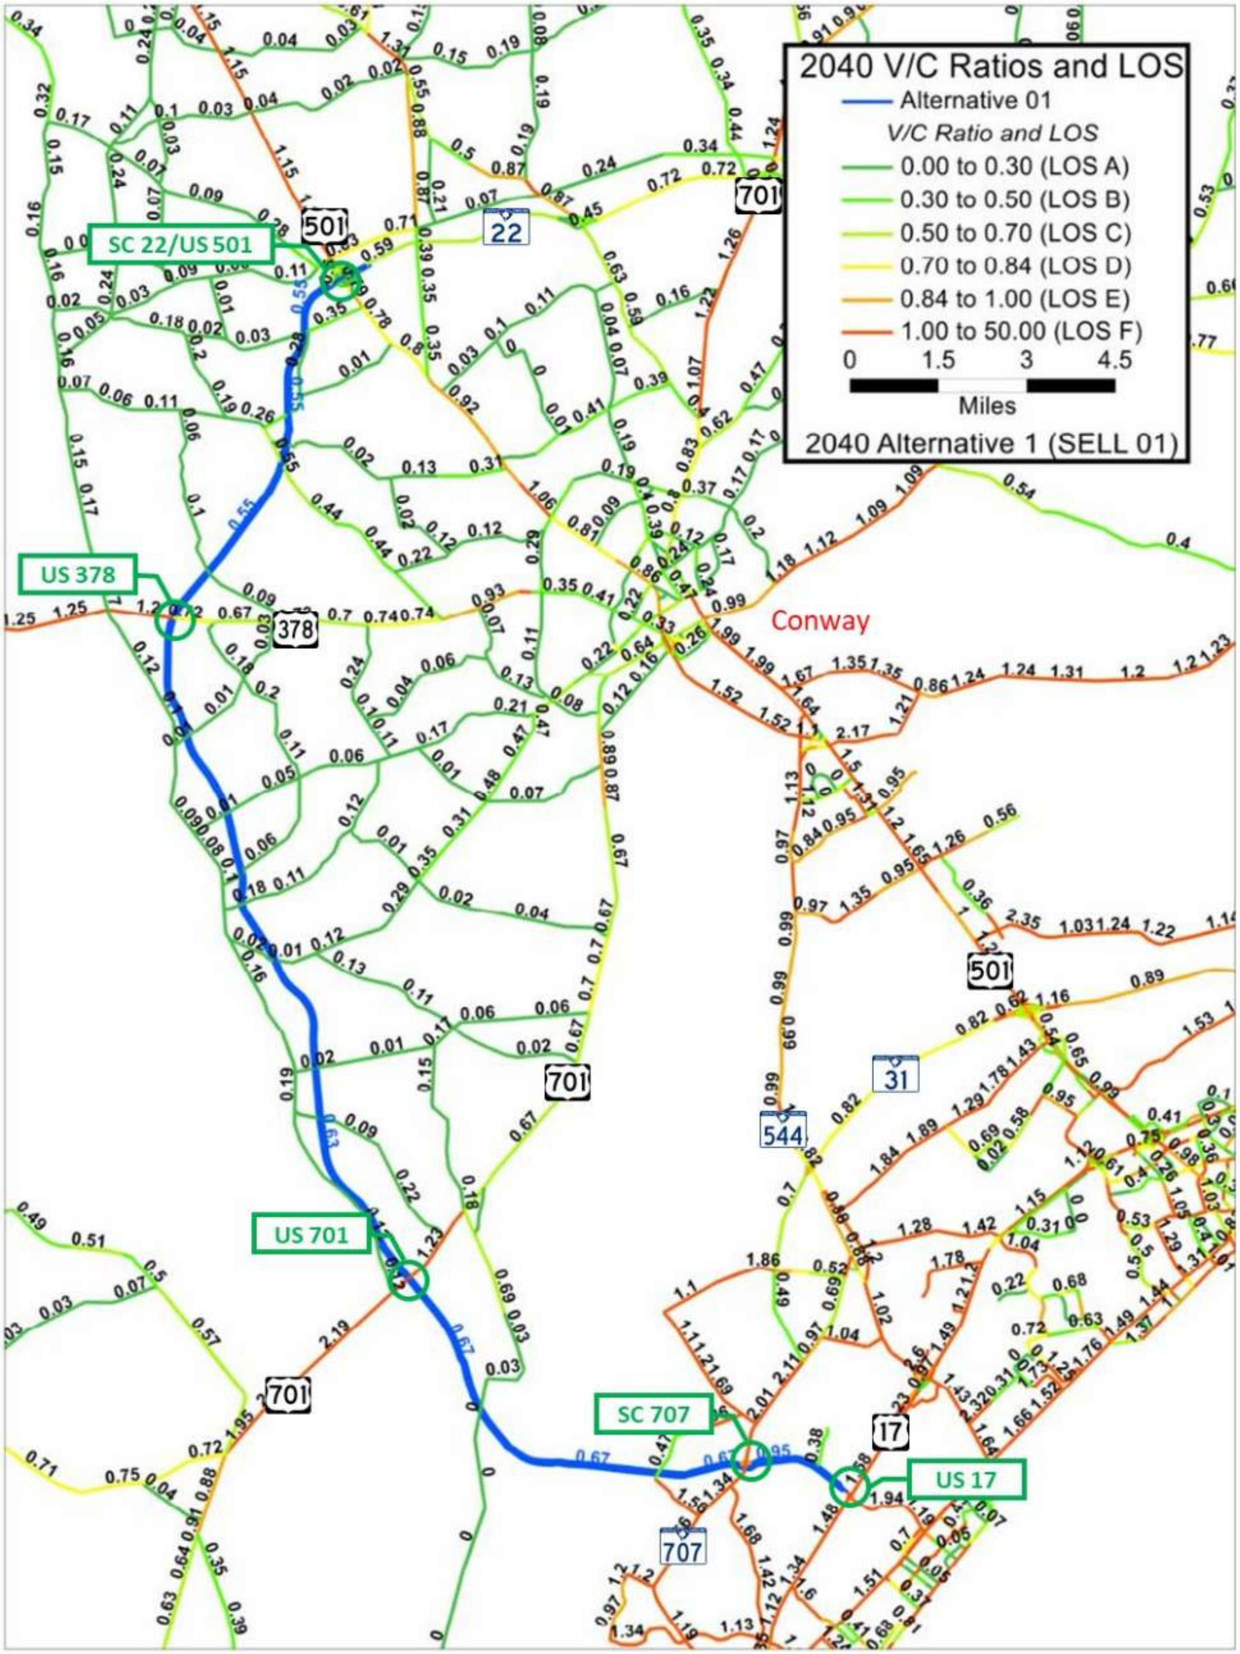

Figure 29 - Alternative 1 V/C and LOS

6.2.3 Alternative 2 (GSATS SELL Alternative 2)

The Alternative 2 V/C and LOS results are shown in **Figure 30**. Alternative 2 includes new alignment between US 17 Bypass and the US 22 interchange at US 501. As a six-lane facility, Alternative 2 is projected to operate between LOS C and LOS D in 2040. Alternative 2 does not include sections of improved existing arterials.

The LOS for key arterial routes in the SELL study area are as follows:

- SC 544 between US 17 and US 501 is predicted to continue to generally operate at LOS E or LOS F, but is expected to experience comparable V/C as Alternative 1.
- US 501 is generally expected to operate at LOS E or LOS F between SC 544 and the US 22 interchange with V/C ratios comparable to those in Alternative 1.
- El Bethel Road/Conway Perimeter Road between US 701 and US 501 is expected to operate at LOS B or better with V/C ratios comparable to Alternative 1.

Similar to Alternative 1, except for portions of the roadways adjacent to the proposed interchanges at US 701, and US 378, traffic on these routes generally is expected to improve to operate at LOS D or better, with some segments operating at LOS E approaching the Conway Perimeter Road. Near the southern terminus of Alternative 2, traffic is expected to increase slightly on SC 707 and US 17 Bypass. Both roads are expected to operate at LOS F, with V/C comparable to Alternative 1.

6.2.4 Alternatives 3 and 5 (GSATS SELL Alternative 3)

The Alternative 3&5 V/C and LOS results are shown in **Figure 31**. Alternative 3&5 includes new alignment between SC 707 and the US 22 interchange at US 501 and includes a portion of existing Holmestown Road between SC 707 and US 17 Bypass. This alternative differs from Alternative 1 in that the northern half of the alternative alignment is east of the Alternative 1 alignment. With a six-lane facility, Alternative 3&5 is projected to operate between LOS B and LOS C in 2040. As part of Alternative 3&5, Holmestown Road would also be anticipated to be improved to provide two additional through lanes and is anticipated to operate between LOS D and LOS F between SC 707 and US 17 Bypass.

The LOS for key arterial routes in the SELL study area are as follows:

- SC 544 between US 17 and US 501 is predicted to continue to generally operate at LOS E or LOS F, but is expected to experience slightly reduced V/C resulting from a shift in traffic to Alternative 3&5. The V/C along the corridor is projected to be similar to Alternatives 1 and 2.
- US 501 is generally expected to operate at LOS E or LOS F between SC 544 and the US 22 interchange. The V/C for Alternative 3&5 are similar to Alternatives 1 and 2.
- El Bethel Road/Conway Perimeter Road between US 701 and US 501 is expected to operate at LOS B or better, comparable to Alternatives 1 and 2.

Roadway segments along US 701 see improvement over Alternatives 1 and 2. Except for portions of the US 701 adjacent to the proposed interchange, US 701 is predicted to operate at LOS D or better in 2040. US 378 is not expected to operate as well in Alternative 3&5 compared to Alternatives 1 and 2. Due to the more eastern alignment of Alternative 3&5, US 378 is expected to generally operate at LOS E or LOS F west of the Conway Perimeter Road.

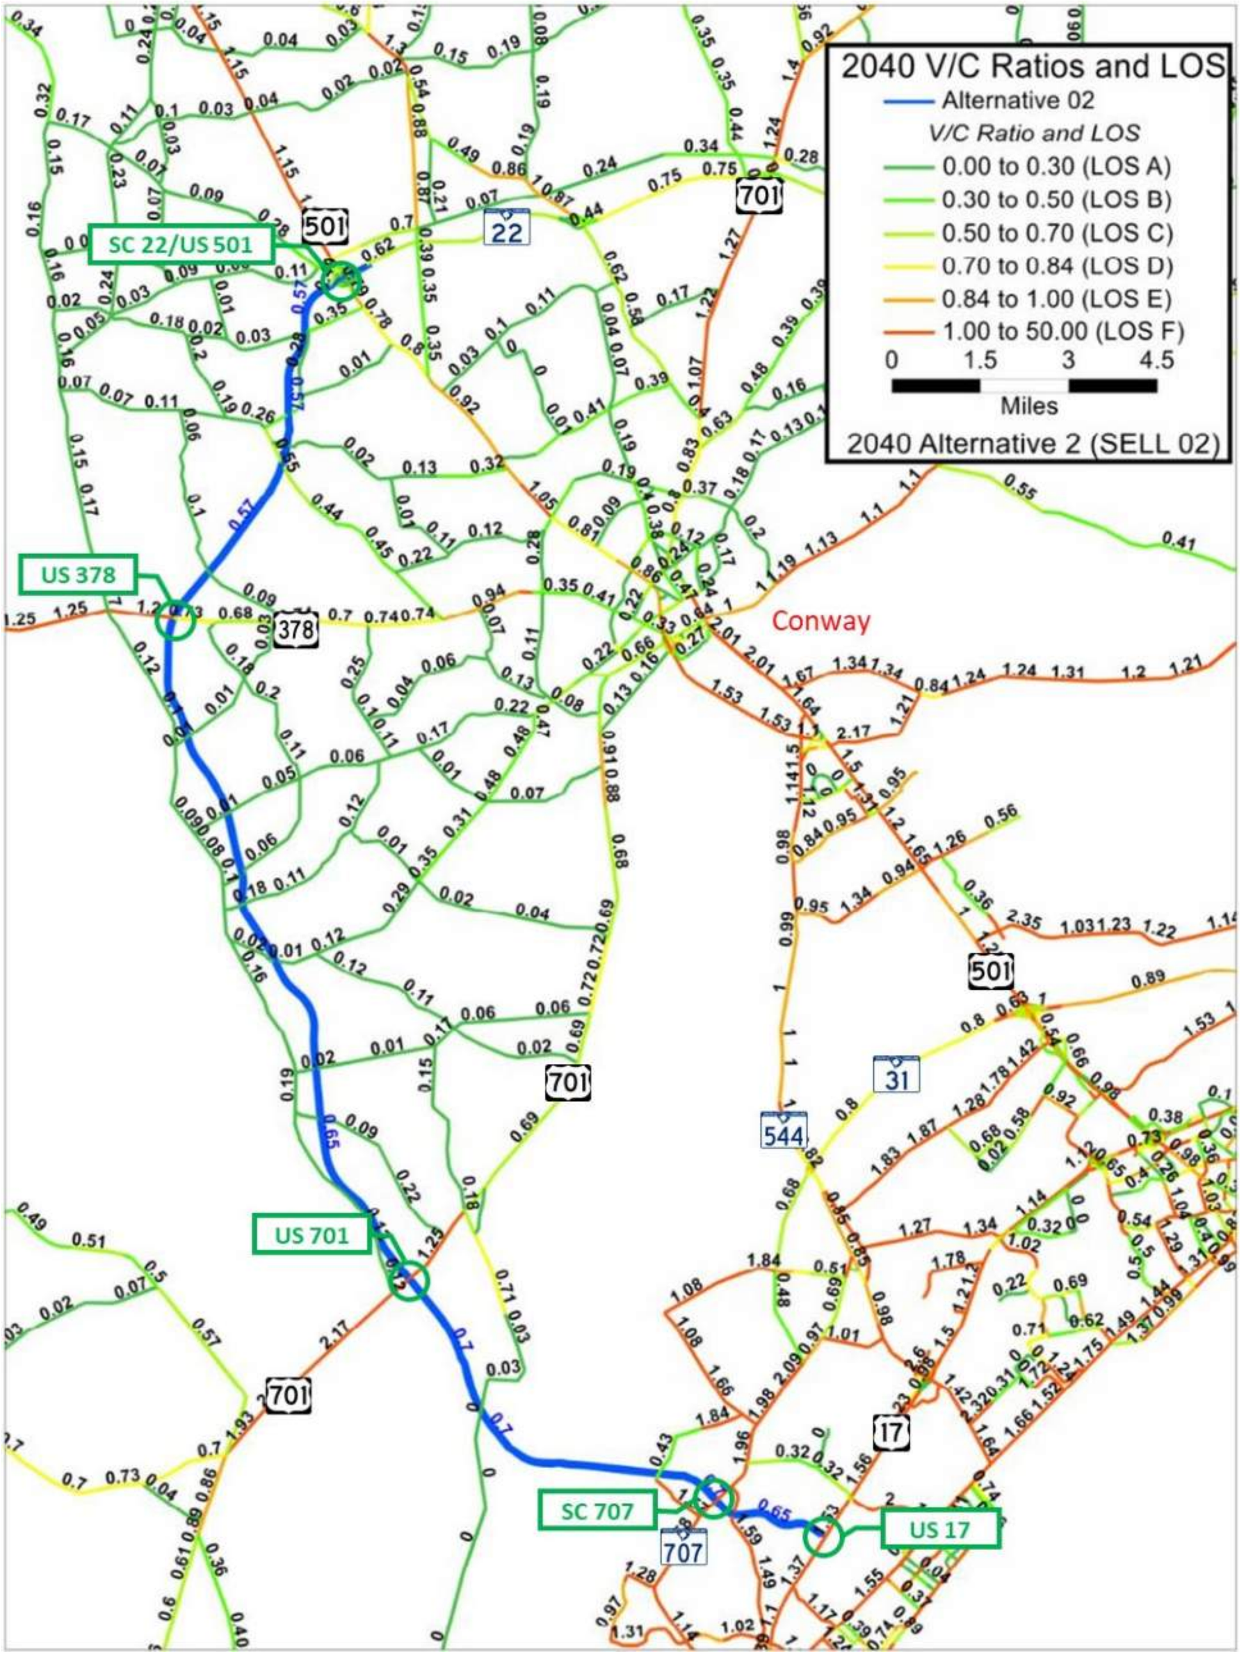

Figure 30 - Alternative 2 V/C and LOS

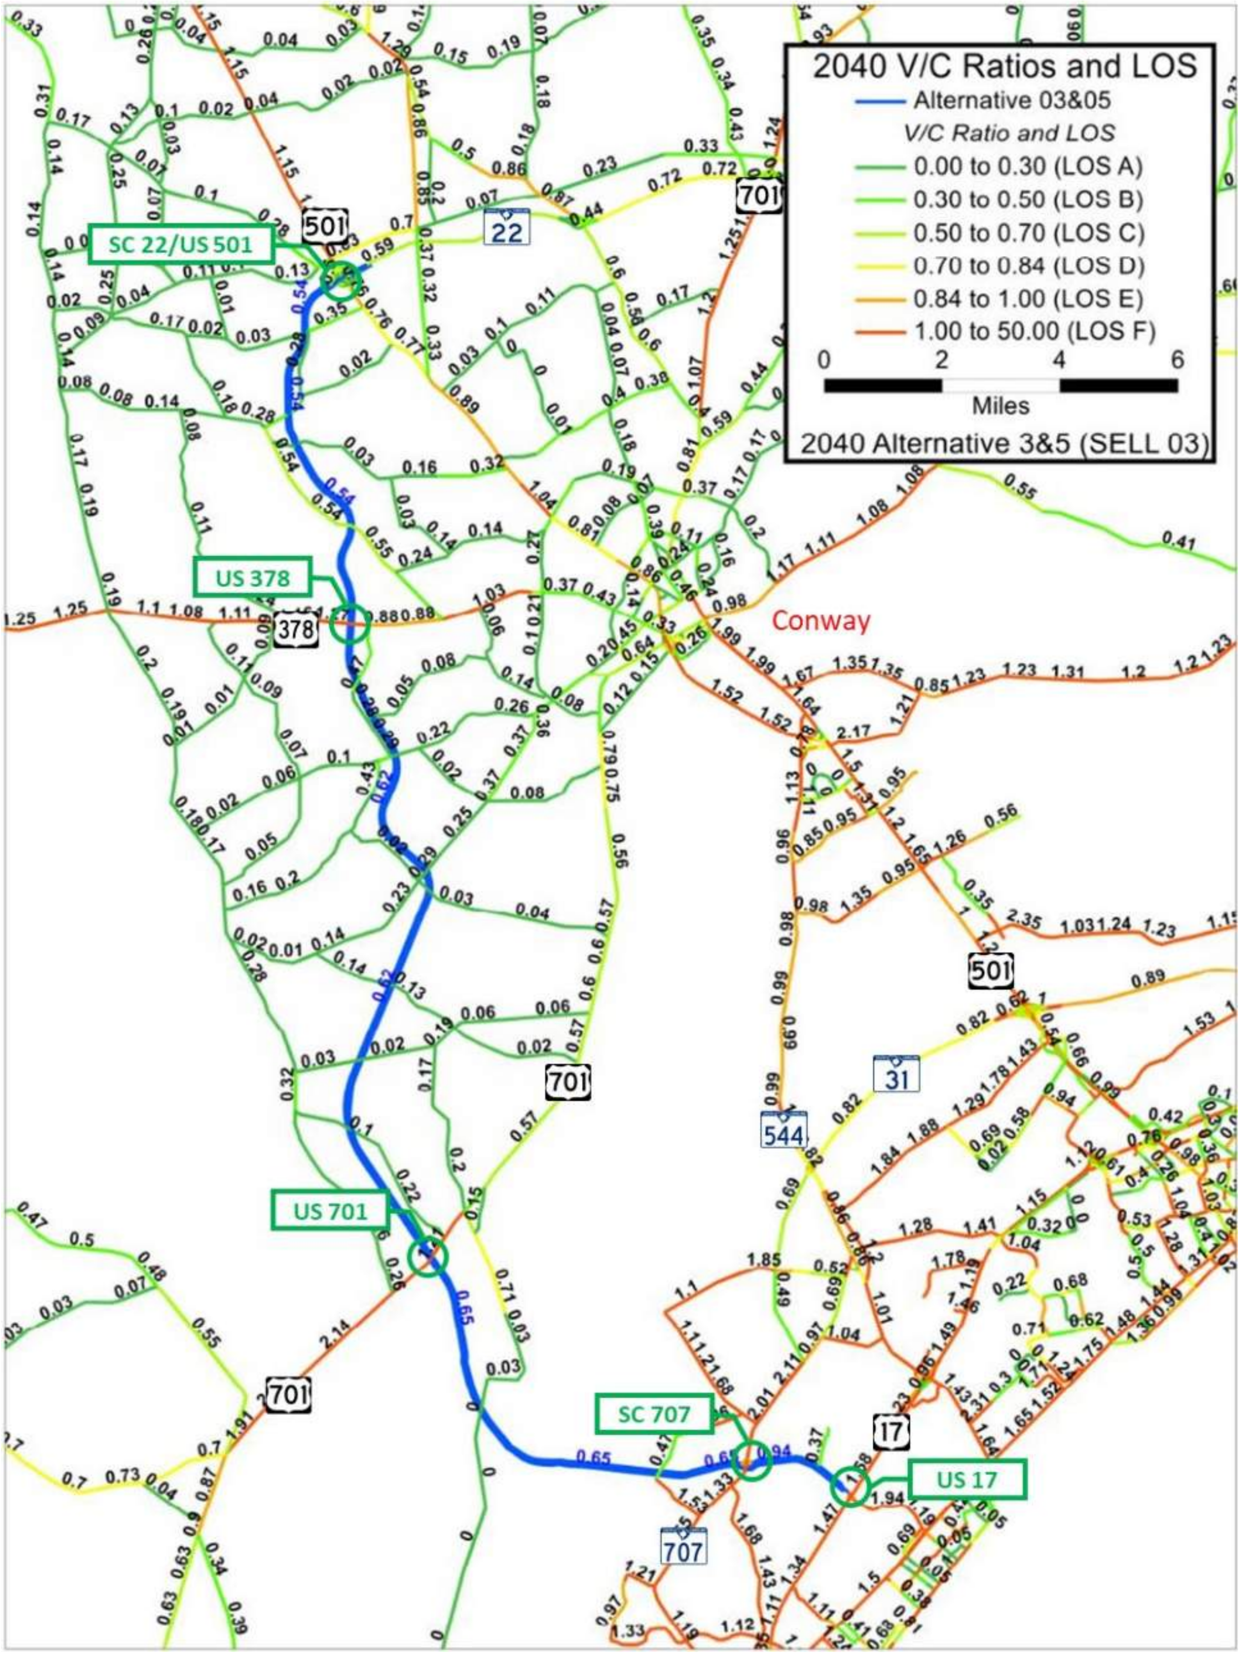

Figure 31 - Alternative 3&5 V/C and LOS

6.2.5 Alternatives 4 and 6 (GSATS SELL Alternative 4)

The Alternative 4&6 V/C and LOS results are shown in **Figure 32**. Alternative 4&6 includes new alignment between US 17 Bypass and the US 22 interchange at US 501. This alternative differs from Alternative 2 in that the northern half of the alternative alignment is east of the Alternative 2 alignment, similar to Alternative 3&5. As a six-lane facility, Alternative 4&6 is projected to operate at LOS C in 2040. Alternative 4&6 does not include sections of improved existing arterials.

The LOS for key arterial routes in the SELL study area are as follows:

- SC 544 between US 17 and US 501 is predicted to continue to generally operate at LOS E or LOS F, but is expected to experience comparable V/C as the previous three alternatives.
- US 501 is generally expected to operate at LOS E or LOS F between SC 544 and the US 22 interchange with V/C ratios comparable to those in the previous three alternatives.
- El Bethel Road/Conway Perimeter Road between US 701 and US 501 is expected to operate at LOS B or better with V/C ratios comparable to the previous three alternatives.

Similar to Alternative 3&5, roadway segments along US 701 see improvement over Alternatives 1 and 2. Except for portions of the US 701 adjacent to the proposed interchange, US 701 is predicted to operate at LOS D or better in 2040. US 378 is not expected to operate as well in Alternative 4&6 compared to Alternatives 1 and 2. Due to the more eastern alignment of Alternative 3&5, US 378 is expected to generally operate at LOS E or LOS F west of the Conway Perimeter Road.

6.2.6 Alternative 7 (GSATS SELL Alternative 5)

The Alternative 7 V/C and LOS results are shown in **Figure 33**. The northern portion of the Alternative 7 alignment is similar to that of Alternatives 3&5 and 4&6, but the southern portion of the alignment shifts away from US 17 Bypass and SC 707 west of SC 544 to a terminus on SC 31 between US 501 and SC 544. It includes interchanges at SC 544 in addition to US 701 and US 378. As a six-lane facility, the Alternative 7 segments west of US 701 are generally projected to operate at LOS C and D, with the segment crossing the Waccamaw River between SC 544 and US 701 projected to operate at LOS F. This section of Alternative 7 would need to provide eight lanes to reduce the 1.07 V/C. Alternative 7 does not include sections of improved existing arterials.

The LOS for key arterial routes in the SELL study area are as follows:

- SC 544 segments adjacent to the Alternative 7 terminus see an increase in V/C and are projected to operate at LOS F. The segments of SC 544 between Alternative 7 and SC 31 see the most increase in V/C. SC 544 segments closer to US 501 see reductions in V/C.
- US 501 segments see a reduction in V/C under Alternative 7 compared to the previous four alternatives. This is likely due to traffic shifting from US 501 to Alternative 7. V/C is reduced approximately 10-15 percent compared to the previous four alternatives.
- El Bethel Road/Conway Perimeter Road between US 701 and US 501 is expected to operate at LOS B or better with V/C ratios comparable to the previous four alternatives.

Roadway segments along US 701 south of Alternative 7 are expected to experience large increases in V/C as traffic is drawn to the proposed SELL alignment. Similarly, US 378 is expected to operate at LOS F west of

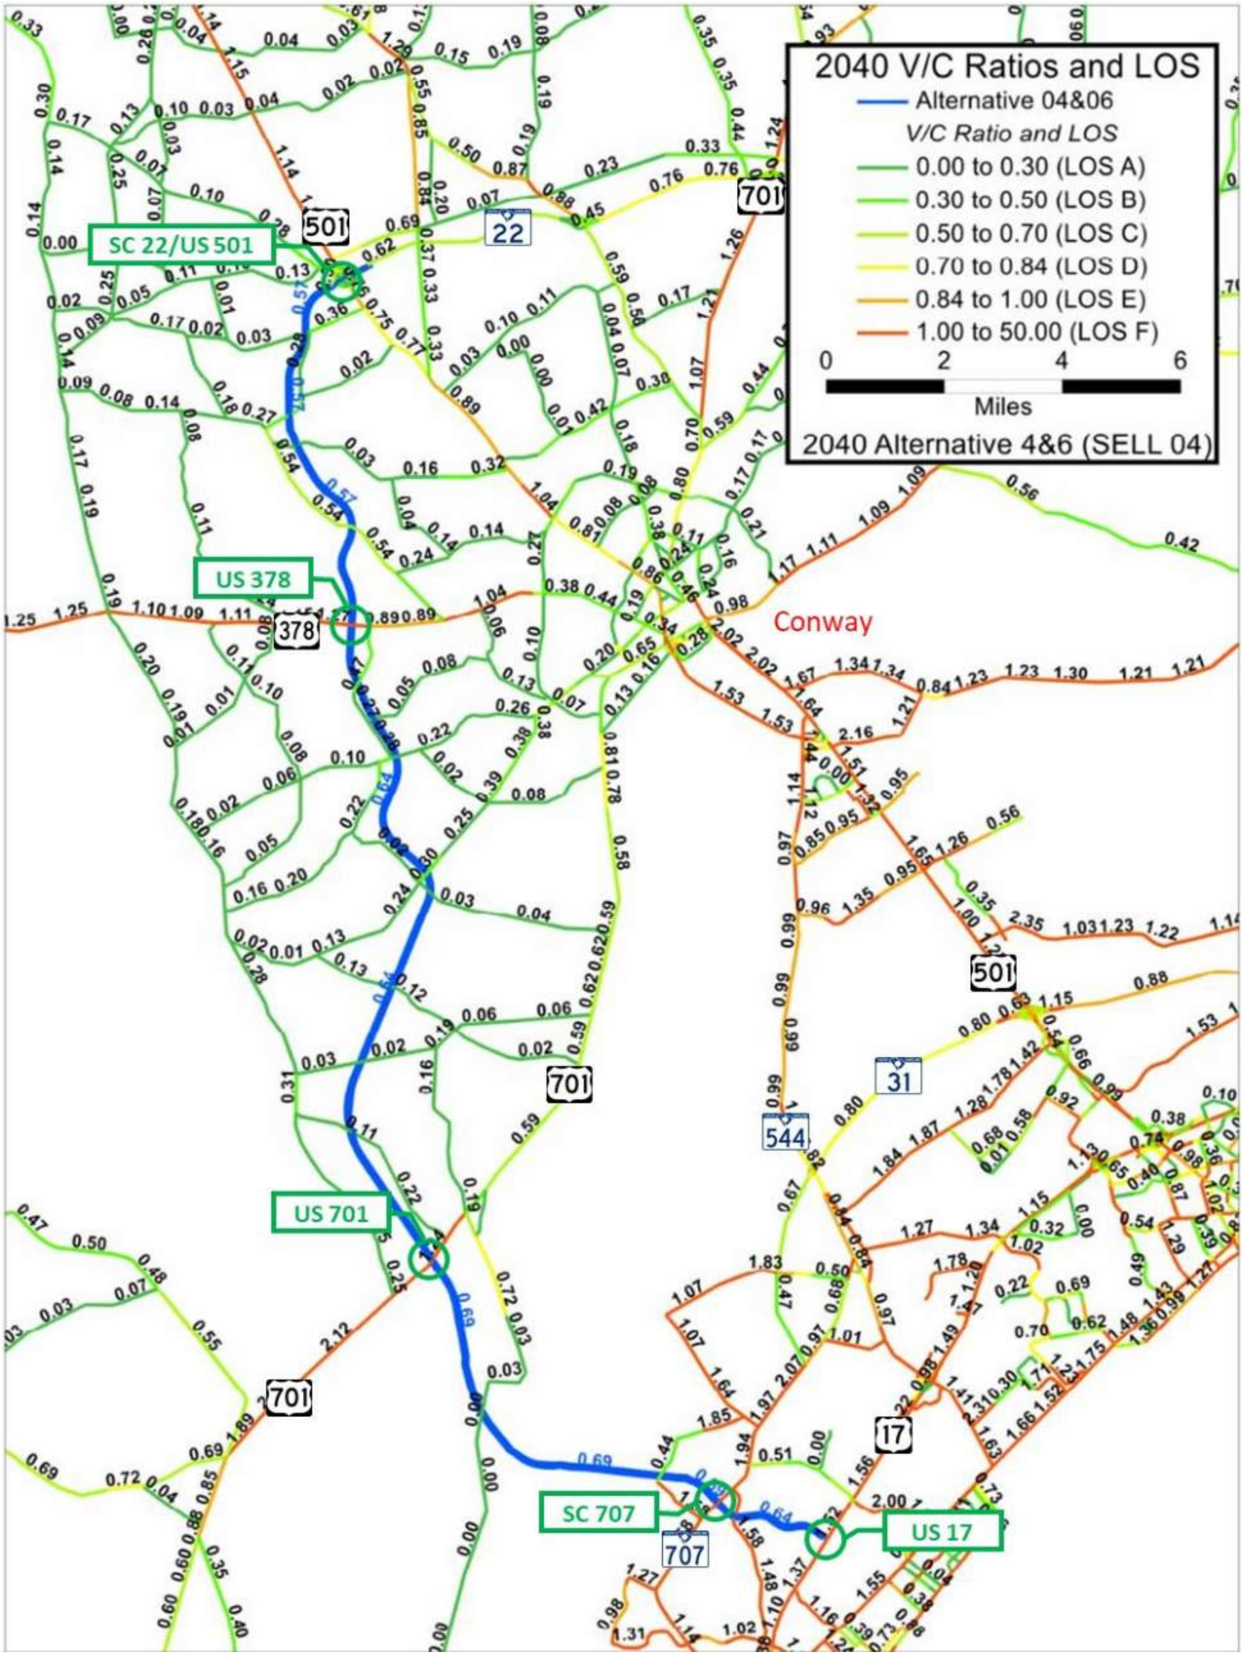

Figure 32 - Alternative 4&6 V/C and LOS

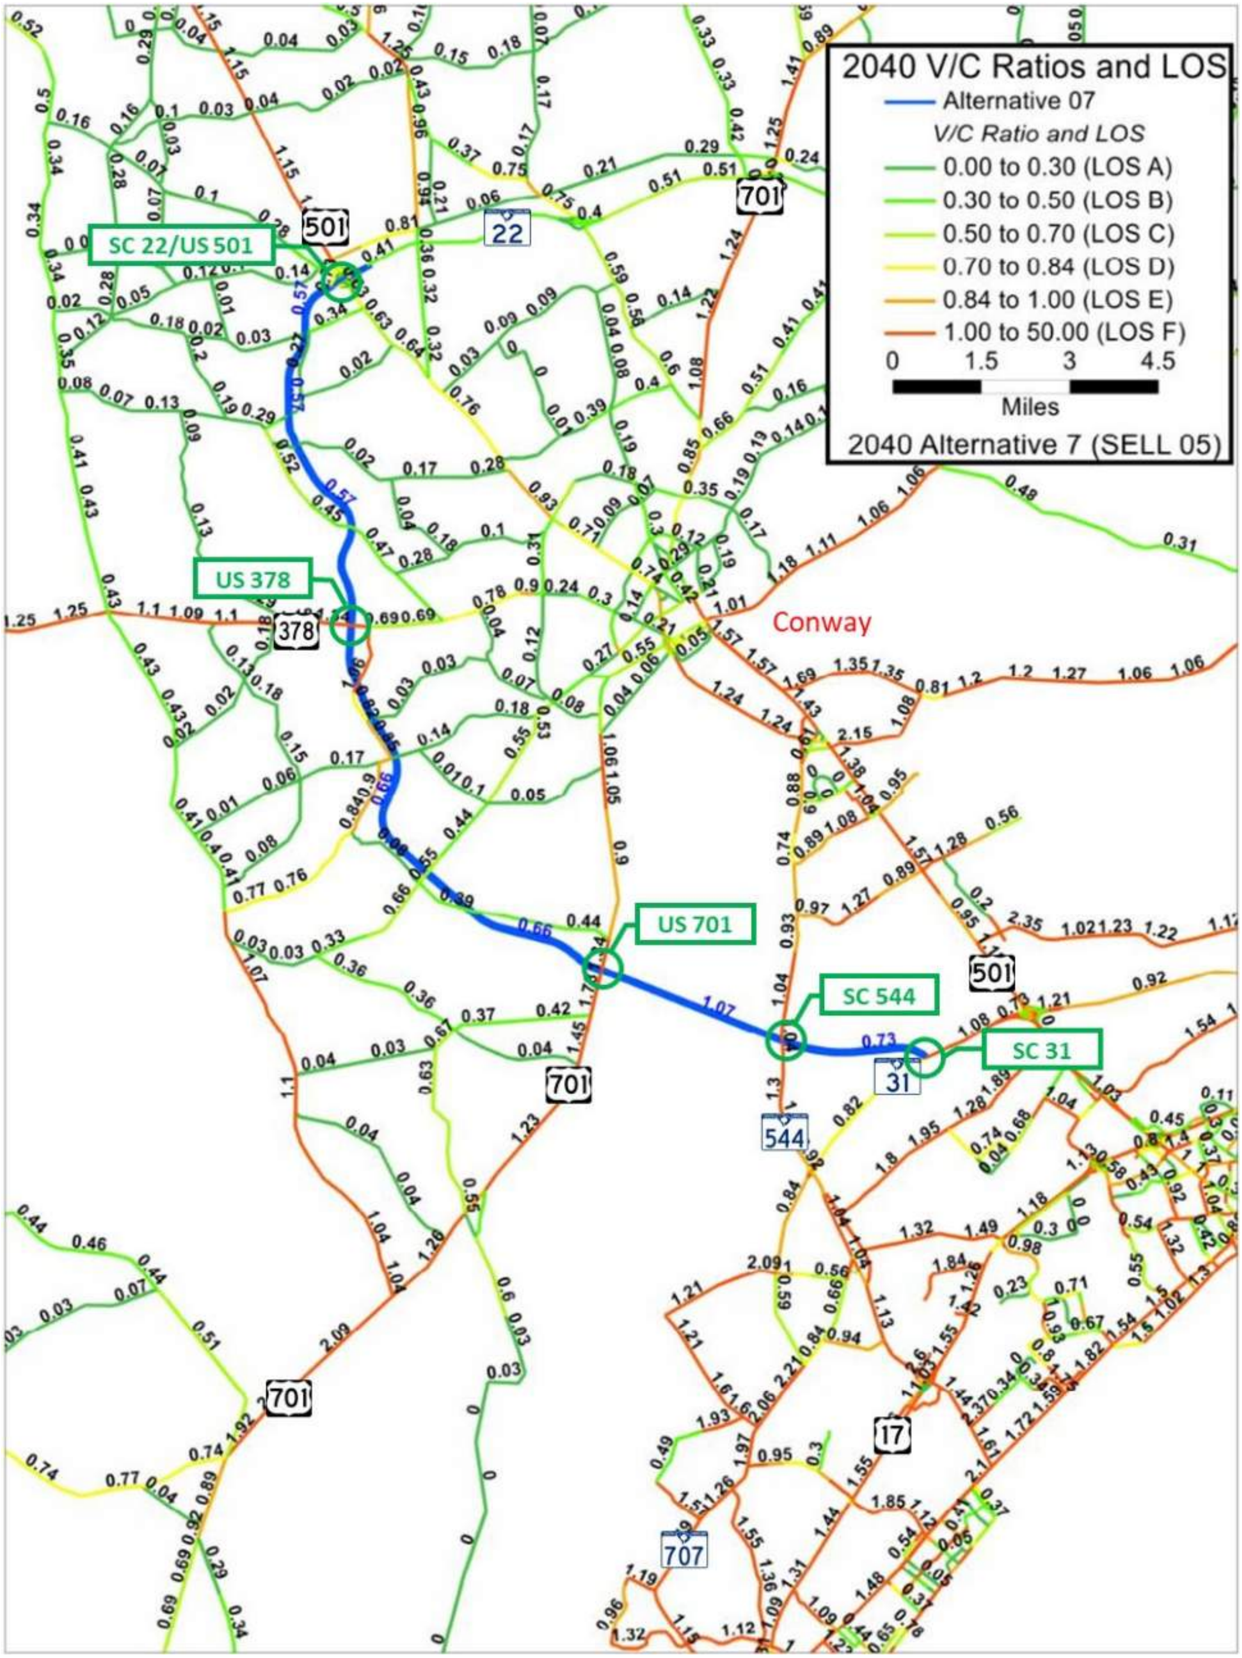

Figure 33 - Alternative 7 V/C and LOS

Alternative 7. East of the interchange towards the Conway Perimeter Road, US 378 is expected to operate at LOS C or D.

6.2.7 Alternatives 8 and 9 (GSATS SELL Alternative 6)

The Alternative 8&9 V/C and LOS results are shown in **Figure 34**. The southern portion of the Alternatives 8&9 alignment is similar to that of Alternative 7, but the alignment takes a sharp turn to the north running parallel to the west of US 701. It then turns northwest, running parallel to US 501. Alternative 8&9 include interchanges at SC 544 in addition to US 701 and US 378. As a six-lane facility, the Alternative 7 segments west of US 701 are projected to operate at LOS C and D, with the segment crossing the Waccamaw River between SC 544 and US 701 projected to operate at LOS F. This section of Alternatives 8&9 would need to provide eight lanes to reduce the 1.06 V/C. Alternative 8&9 does not include sections of improved existing arterials.

The LOS for key arterial routes in the SELL study area are as follows:

- SC 544 segments adjacent to the Alternative 8&9 terminus are expected to operate comparable to Alternative 7. There is a projected increase in V/C and the roadway segments are expected to operate at LOS F. The segments of SC 544 between Alternative 8&9 and SC 31 see the most increase in V/C. SC 544 segments closer to US 501 see reductions in V/C.
- US 501 segments see a reduction in V/C under Alternatives 8&9 are comparable to the Alternative 7 V/C.
- El Bethel Road/Conway Perimeter Road between US 701 and US 501 is expected to operate at LOS B or better. The V/C ratios are projected to increase along the Conway Perimeter Road north of US 378.

Comparable to Alternative 7, roadway segments along US 701 south of Alternative 8&9 are expected to experience large increases in V/C as traffic is drawn to the proposed SELL alignment. The roadway segments of US 701 north of Alternative 8&9 towards the Conway Perimeter Road are lower in Alternative 8&9 compared to Alternative 7. US 378 is expected to operate at LOS F west of the Alternative 8&9 interchange and to the east of the interchange towards the Conway Perimeter Road.

6.2.8 Alternatives 10 and 11 (GSATS SELL Alternative 7)

The Alternative 10&11 V/C and LOS results are shown in **Figure 35**. Alternative 10&11 keeps the northern portion of the alignment of Alternative 8&9, but instead of crossing the Waccamaw River to connect to SC 544 and SC 31, runs parallel to the north of US 701 for about 5.5 miles before following the southern portion of the alignment common to Alternatives 1 and 3&5, including the portion of the alignment following a widened portion of Holmestown Road.

With a six-lane facility, Alternative 10&11 is projected to operate between LOS B and LOS C in 2040. As part of Alternative 10&11, Holmestown Road would also be anticipated to be improved to provide two additional through lanes and is anticipated to operate between LOS D and LOS F between SC 707 and US 17 Bypass.

The LOS for key arterial routes in the SELL study area are as follows:

- SC 544 between US 17 and US 501 is predicted to continue to generally operate at LOS E or LOS F and is expected to have V/C comparable to Alternatives 1, 2, 3&5, and 4&6.

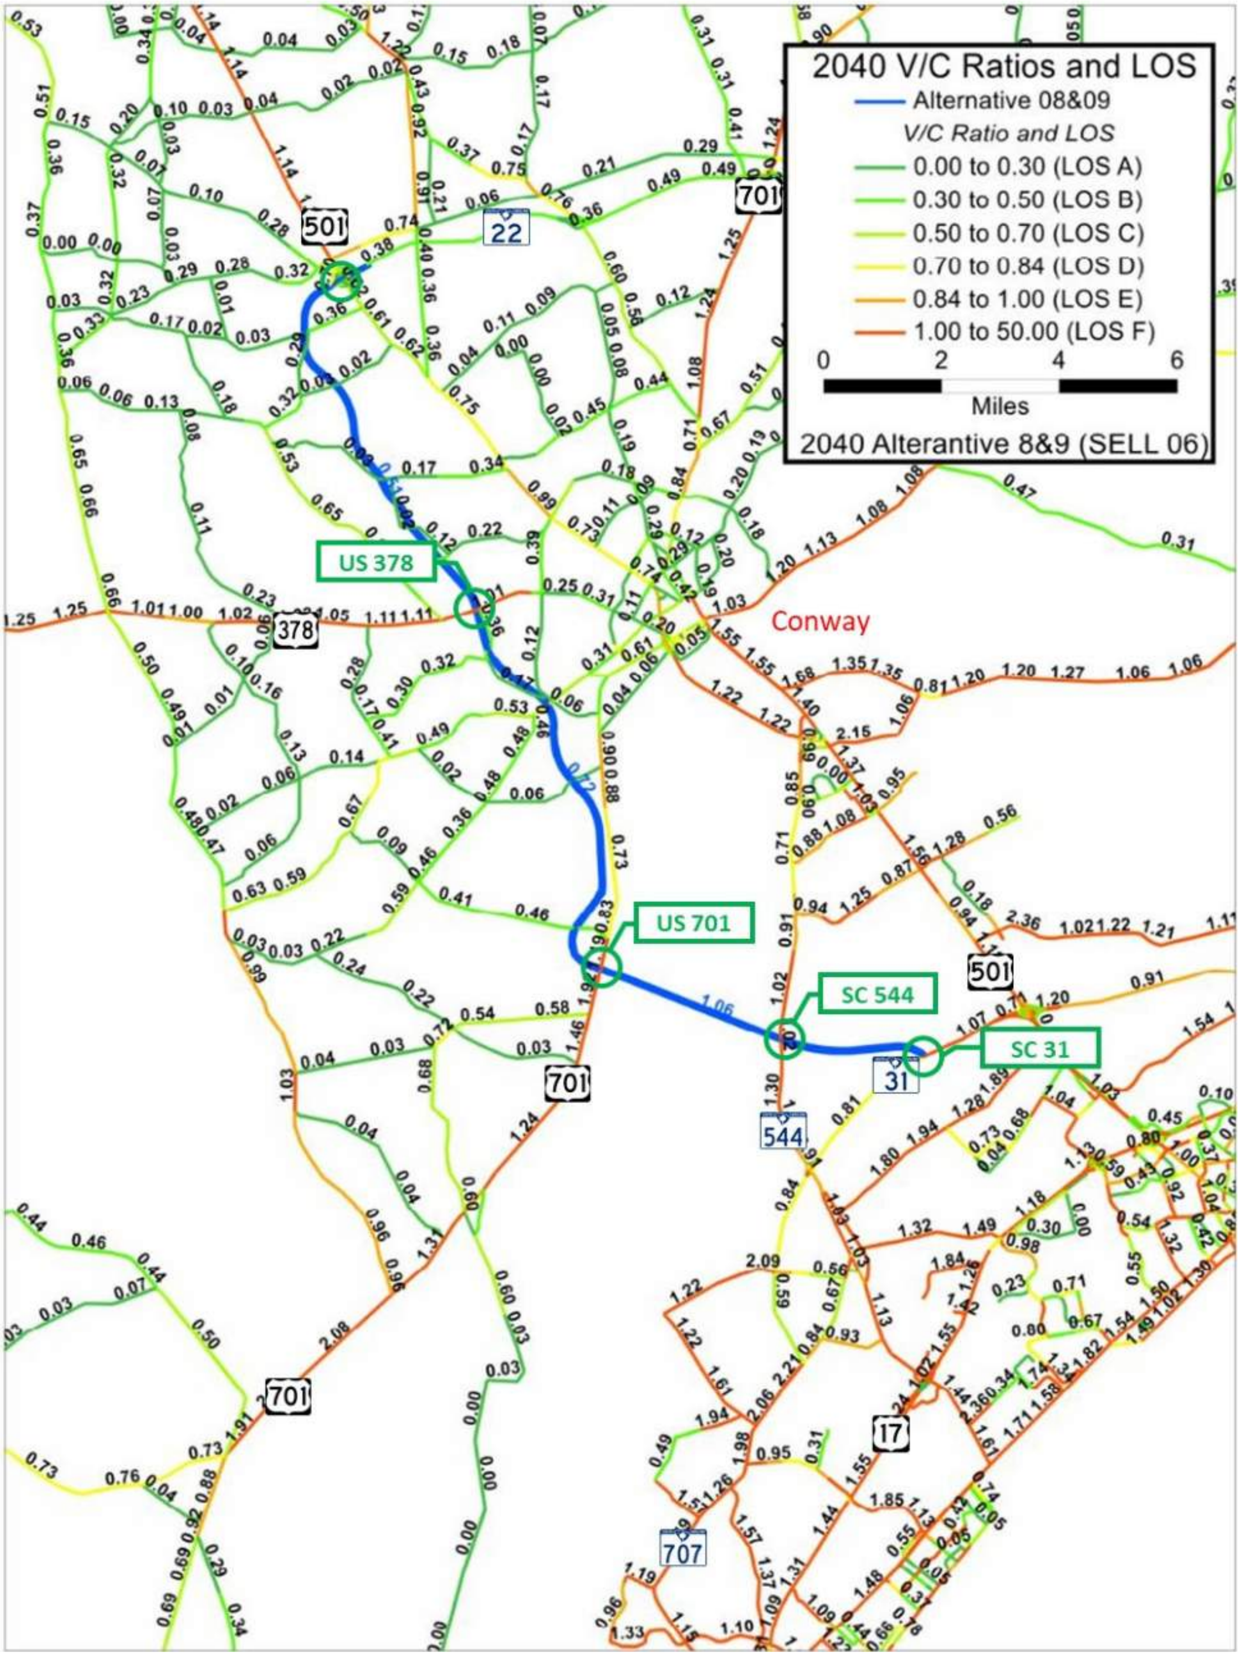

Figure 34 - Alternative 8&9 V/C and LOS

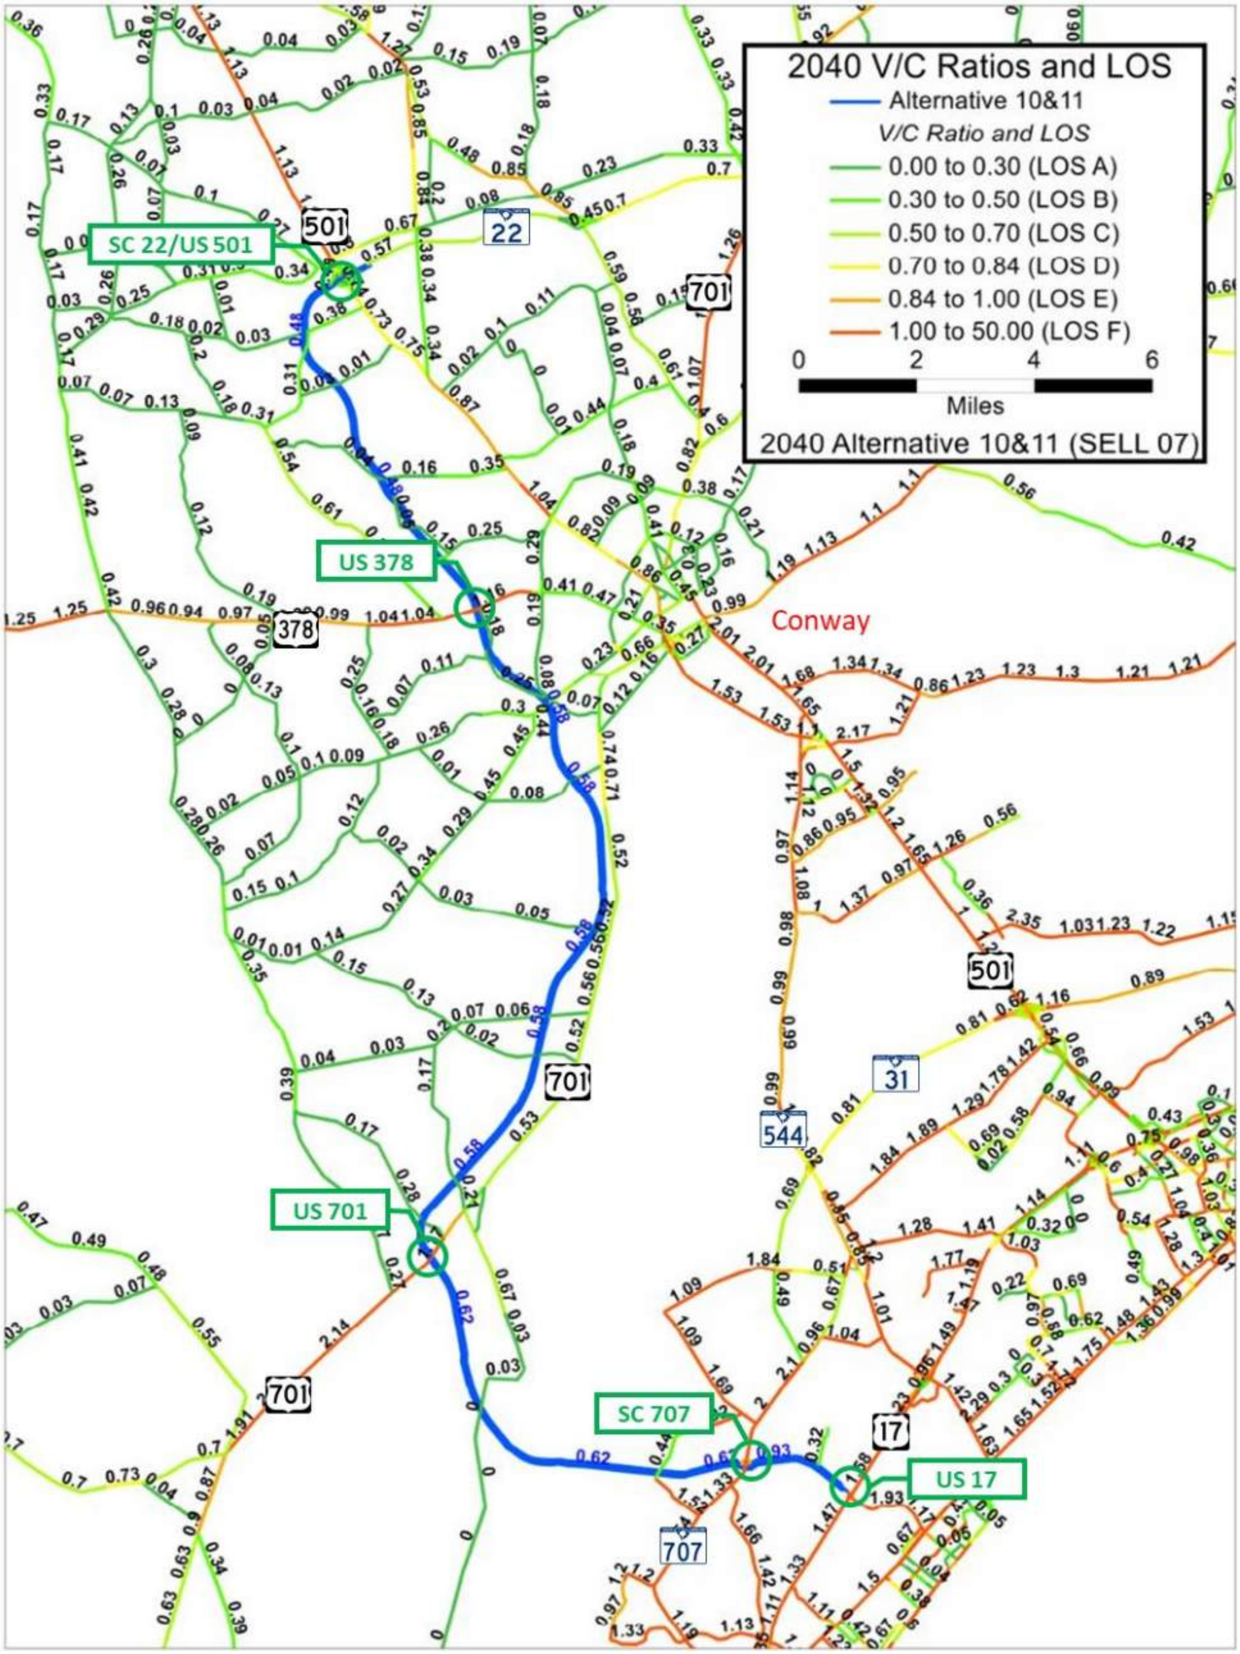

Figure 35 - Alternative 10&11 V/C and LOS

- US 501 is generally expected to operate at LOS E or LOS F between SC 544 and the US 22 interchange. The V/C for Alternative 10&11 are similar to Alternatives 1, 2, 3&5, and 4&6.
- El Bethel Road/Conway Perimeter Road between US 701 and US 501 is expected to operate at LOS B or better, comparable to the previous alternatives.

Roadway segments along US 701 see substantial reduction in V/C in Alternative 10&11 east of its interchange continuing up towards Conway Perimeter Road. Alternative 10&11 runs parallel for approximately seven miles just to the north of US 701 and is projected to operate generally at LOS C or LOS D. West of the interchange, US 701 is predicted to operate at LOS F in 2040. US 378 is expected to operate at LOS E or F west of its interchange with Alternative 10&11, as well to the east of its interchange towards Conway Perimeter Road.

6.2.9 Alternatives 12 and 13 (GSATS SELL Alternative 8)

The Alternative 12&13 V/C and LOS results are shown in **Figure 36**. Alternative 12&13 keeps the same alignment as Alternative 10&11, but with the southern terminus coinciding with Alternatives 2 and 4&6, like Alternative 10&11, Alternative 12&13 runs generally parallel to the north of US 701 before turning to the north to run generally parallel to the west of US 501. With a six-lane facility, Alternative 12&13 is projected to operate at LOS C in 2040.

The LOS for key arterial routes in the SELL study area are as follows:

- SC 544 between US 17 and US 501 is predicted to continue to generally operate at LOS E or LOS F and is expected to have V/C comparable to Alternatives 1, 2, 3&5,4&6, and 10&11.
- US 501 is generally expected to operate at LOS E or LOS F between SC 544 and the US 22 interchange. The V/C for Alternative 10&11 are similar to Alternatives 1, 2, 3&5, 4&6, and 10&11.
- El Bethel Road/Conway Perimeter Road between US 701 and US 501 is expected to operate at LOS B or better, comparable to the previous alternatives.

As in Alternative 10&11, roadway segments along US 701 in Alternative 12&13 see substantial reduction in V/C east of its interchange continuing up towards Conway Perimeter Road, since about seven miles of both Alternatives run just to the north of US 701. US 701 north/east of the interchange is projected to operate generally at LOS C or LOS D. West of the interchange, US 701 is predicted to operate at LOS F in 2040. US 378 is expected to operate at LOS E or F west of its interchange with Alternative 10&11, as well as to the east of its interchange towards Conway Perimeter Road.

6.2.10 Alternative 14 (GSATS SELL Alternative 9)

The Alternative 14 V/C and LOS results are shown in **Figure 37**. Alternative 14 makes extensive use of existing routes incorporating two additional lanes to the existing lane configuration with a short, approximately 3.5-mile section of a new, six-lane alignment. The southern terminus of Alternative 14 begins at US 17 Bypass and continues north towards US 501 where a section of new alignment runs to the west, generally parallel to, and south of, US 501, before connecting to a widened Conway Perimeter Road. Where the Conway Perimeter Road intersects US 501, Alternative 14 then coincides with US 501 to the west to its interchange with US 22.

The new alignment section of Alternative 14 is expected to operate at LOS E and LOS F in 2040. To reduce the V/C, an eight-lane section would be required on the new alignment.

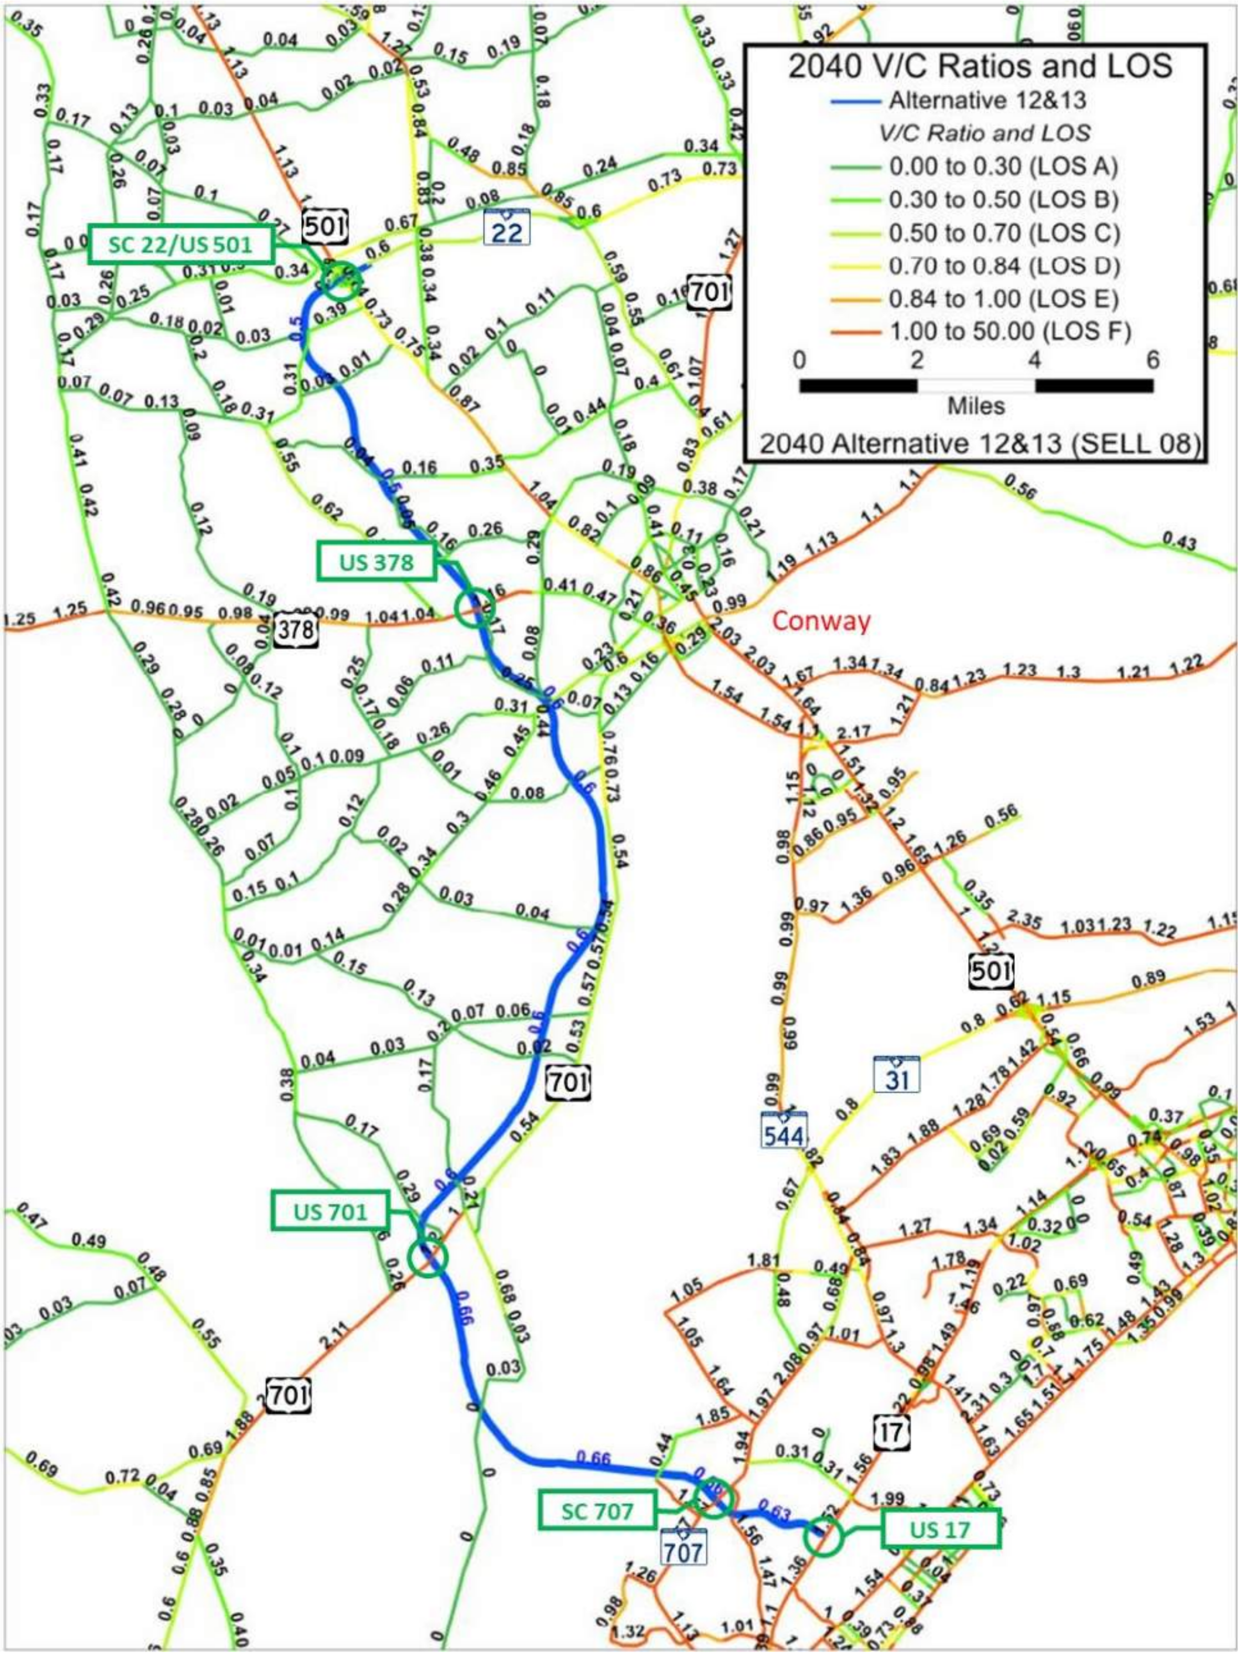

Figure 36 - Alternative 12&13 V/C and LOS

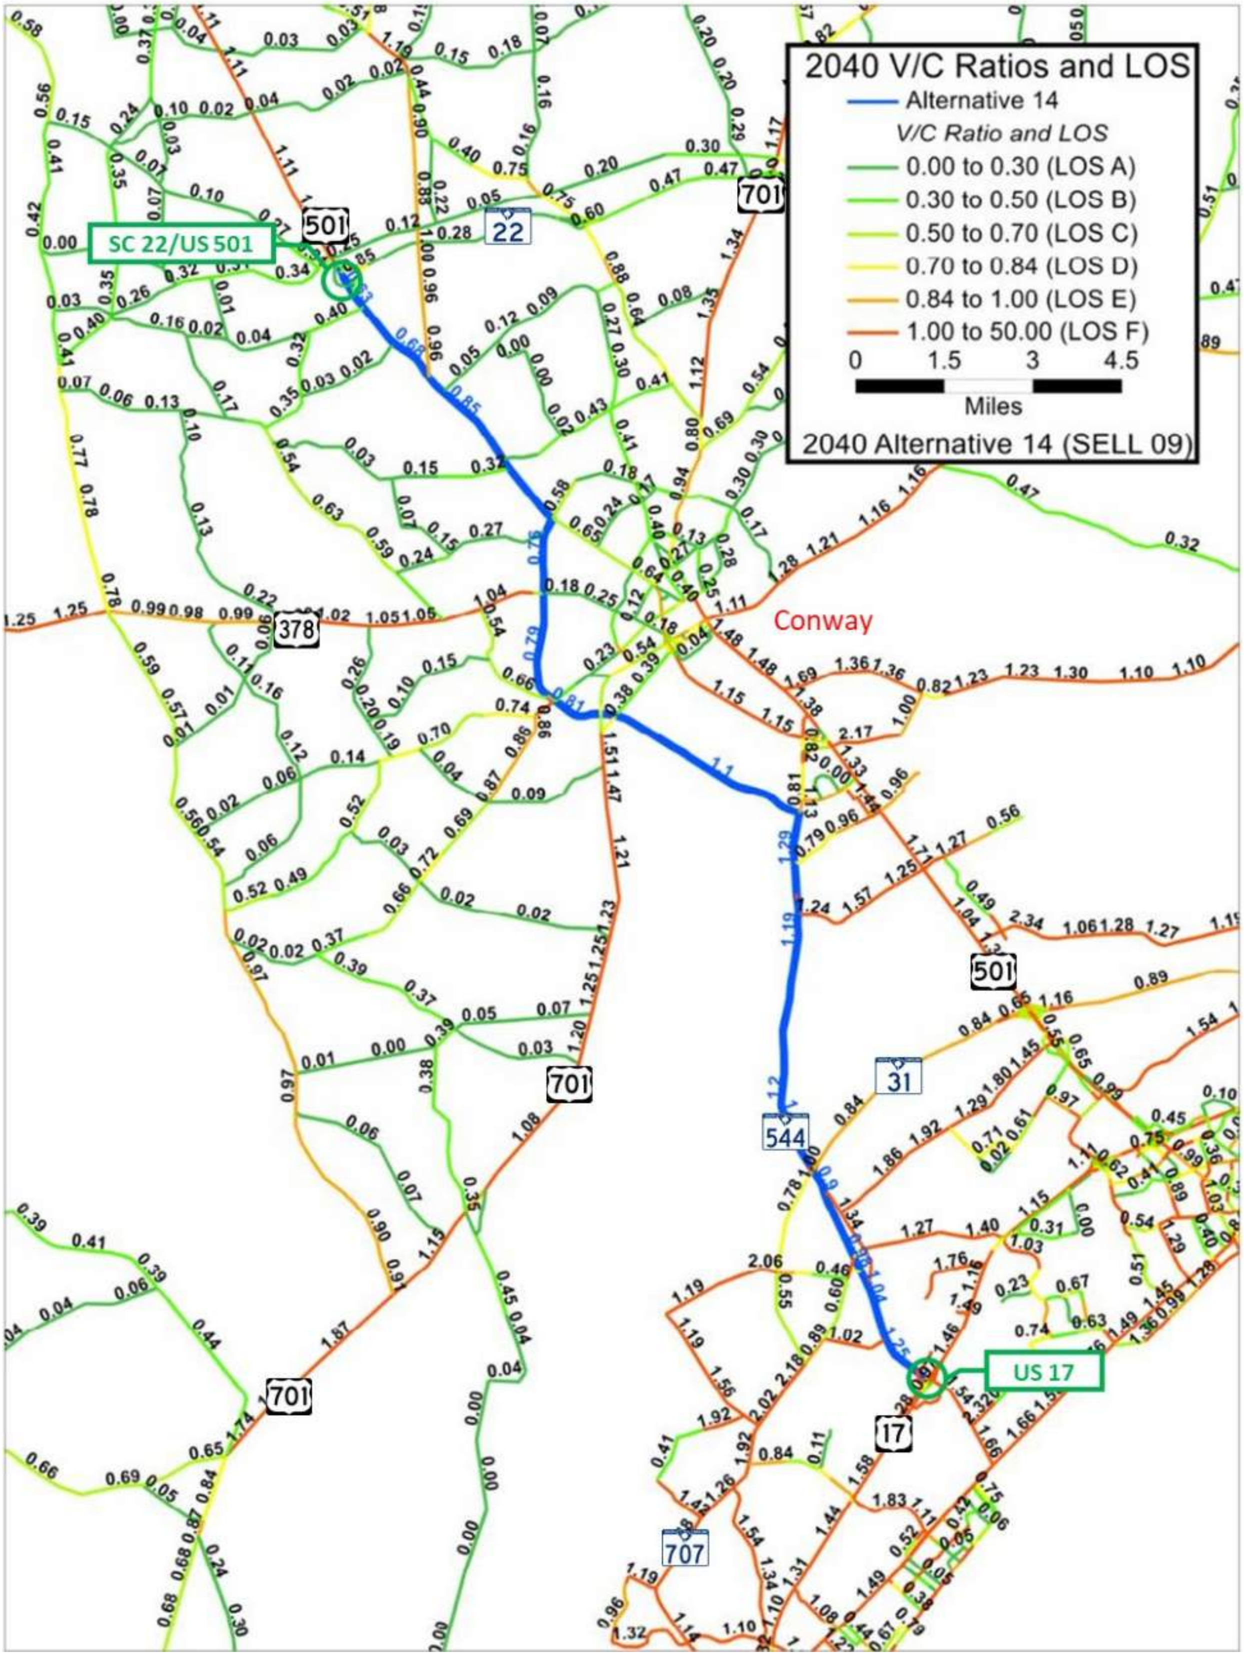

Figure 37 - Alternative 14 V/C and LOS

The LOS for key arterial routes in the SELL study area are as follows:

- SC 544 between US 17 and the new alignment section is predicted to continue to generally operate at LOS F with some V/C ratios higher than in the other alternatives that do not incorporate widening along SC 544. The proposed widening of SC 544 attracts sufficient traffic that, even with the additional capacity, traffic volumes will increase such that the overall V/C will be higher. Between the new alignment section and US 501, the improved existing arterial segments are predicted to have lower V/C than in most of the other alternatives due to the new alignment section attracting traffic away from US 501.
- In Alternative 14, US 501 is generally expected to experience reduced V/C from SC 544 to US 378 than in the other SELL Alternatives, but is still anticipated to operate at LOS E or LOS F. The V/C for Alternative 14 along these sections of US 501 are similar to those obtained in Alternatives 7 and 8&9. From US 378 to the SC 22 interchange, US 501 is expected to operate at LOS C to LOS E, with V/C comparable to Alternatives 7 and 8&9, which do not include the additional capacity incorporated into Alternative 14.
- El Bethel Road/Conway Perimeter Road connects the new alignment in Alternative 14 between SC 544 and US 501. This connection is expected to result in increased traffic along the Conway Perimeter Road, with the segments operating at LOS D or LOS E.

In Alternative 14, roadway segments along both US 701 and US 378 generally are expected to operate at LOS F throughout the SELL study area towards Conway Perimeter Road.

6.2.11 Alternative 15 (GSATS SELL Alternative 10)

The Alternative 15 V/C and LOS results are shown in **Figure 38**. Alternative 15 also makes extensive use of existing routes incorporating two additional lanes to the existing lane configuration. Alternative 15 incorporates an approximately three-mile section of a new, six-lane alignment that connects US 501 to the Conway Perimeter Road.

The southern terminus of Alternative 15 is on SC 544 at US 17 Bypass. Alternative 15 continues north on widened SC 544 towards US 501 and to the west along a widened portion of US 501 for less than a mile before the new alignment runs south and then west to connect to a widened Conway Perimeter Road. Where the Conway Perimeter Road intersects US 501, Alternative 15 then coincides with US 501 to the west to its interchange with US 22. The six-lane new alignment section of Alternative 15 is expected to operate at LOS D and LOS E in 2040.

The LOS for key arterial routes in the SELL study area are as follows:

- SC 544 between US 17 and US 501 is predicted to continue to generally operate at LOS F with some higher V/C ratios than in the other alternatives that do not incorporate widening along SC 544. The Alternative 15 V/C is slightly less than the Alternative 14 V/C along SC 544 except for the segments closest to US 501, which are higher in the absence of the Alternative 14 connector between SC 544 and Conway Perimeter Road. Similar to Alternative 14, the proposed widening of SC 544 in Alternative 15 attracts sufficient traffic that, even with the additional capacity, traffic volumes will increase such that the overall V/C will be higher.
- Similar to Alternative 14, US 501 in Alternative 15 is generally expected to experience reduced V/C from SC 544 to US 378 but is still anticipated to operate at LOS E or LOS F. The reduced V/C is comparable to

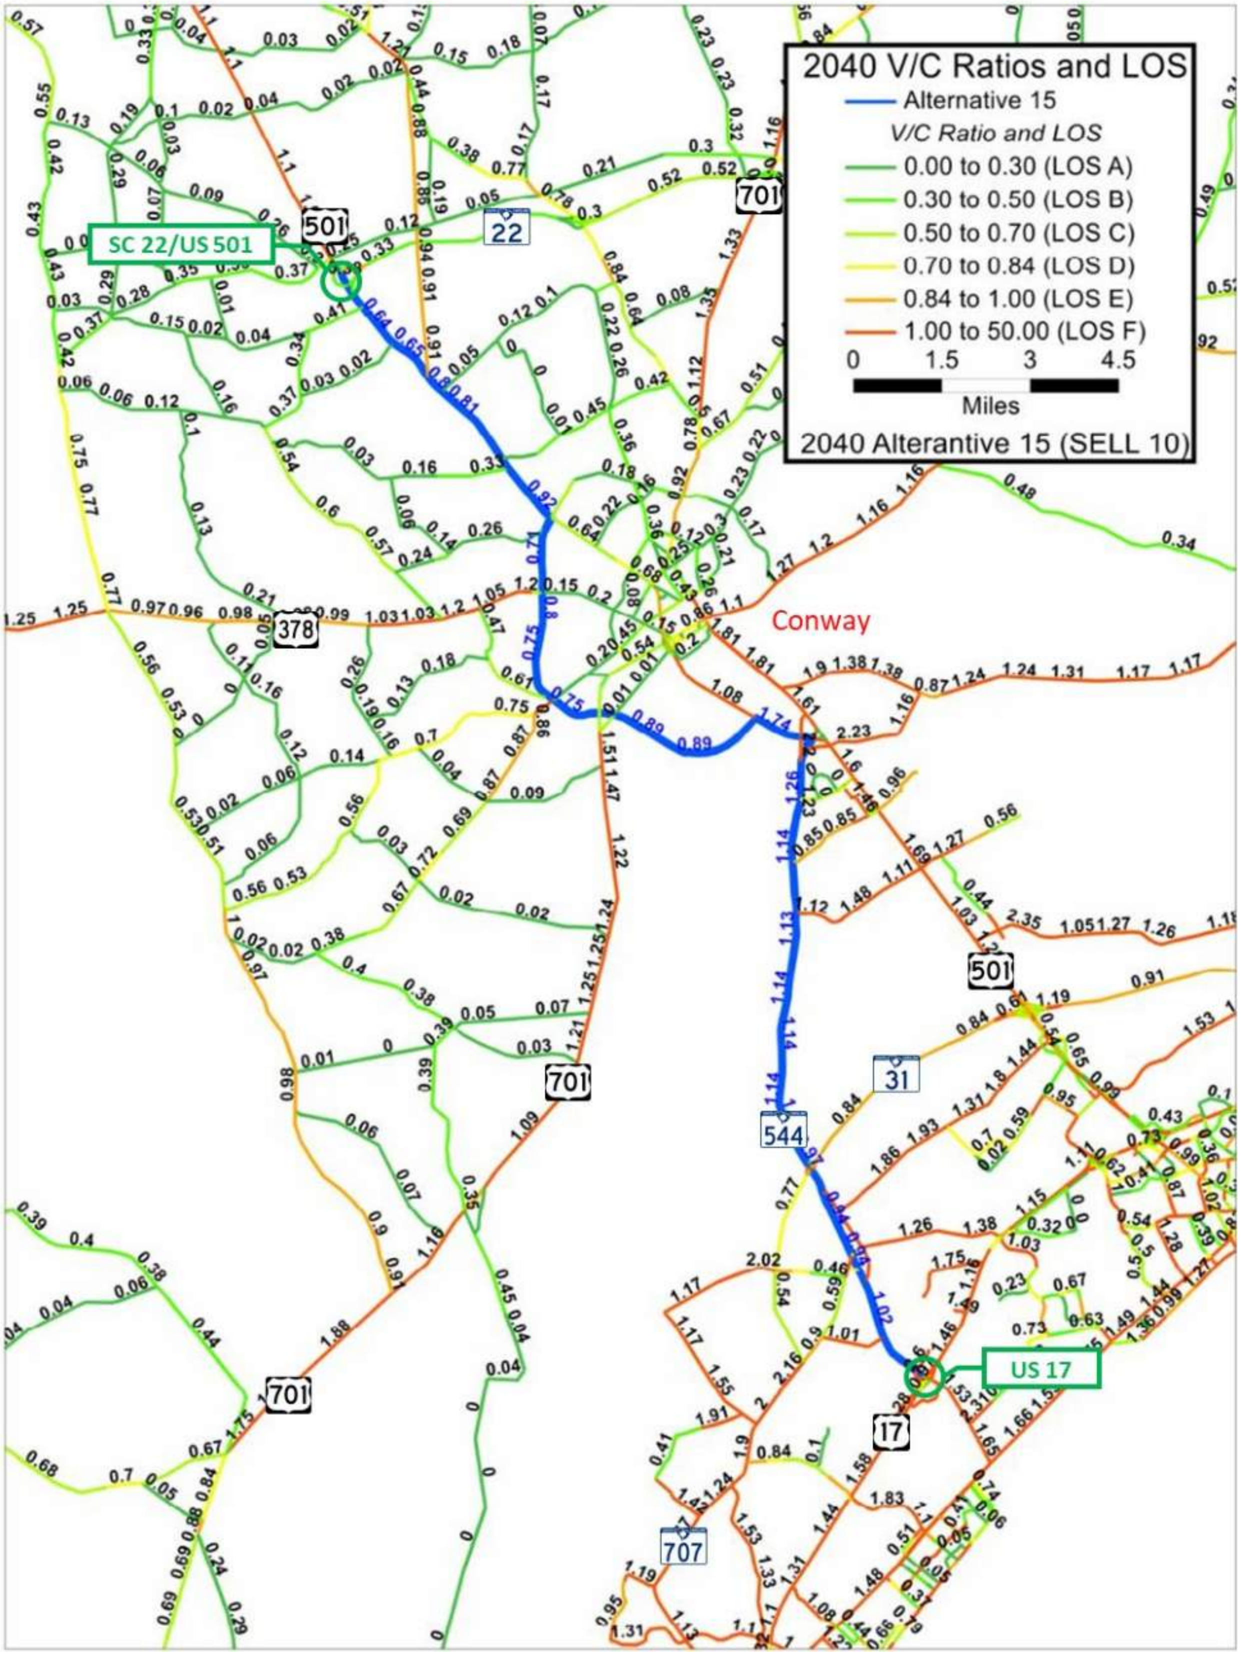

Figure 38 - Alternative 15 V/C and LOS

that estimated in Alternative 14. The V/C for Alternative 15 is also similarly comparable to Alternatives 7 and 8&9, which do not include the additional capacity incorporated into Alternative 15.

- El Bethel Road/Conway Perimeter Road connects the new alignment in Alternative 15 from US 501 near SC 544 and terminates back again at US 501. This connection is expected to result in increased traffic along the Conway Perimeter Road, with the segments operating at LOS D or LOS E, though with slightly lower V/C ratios than are estimated in Alternative 14.

In Alternative 15, roadway segments along both US 701 and US 378 generally are expected to operate at LOS F throughout the SELL study area towards Conway Perimeter Road.

6.2.12 Alternative 16 (GSATS SELL Alternative 11)

The Alternative 16 V/C and LOS results are shown in **Figure 39**. Alternative 16 incorporates only existing arterial roadways with two additional lanes provided to the existing lane configuration. Alternative 16 has no new six-lane, new alignment SELL sections.

The southern terminus of Alternative 16 is on SC 544 at US 17 Bypass. Alternative 16 continues north on widened SC 544 towards US 501 and to the west along a widened portion of US 501 to its interchange with US 22. Alternative 16 does not incorporate sections of the Conway Perimeter Road.

North of US 378, most of the segments are classified as LOS C or LOS D, with the V/C generally decreasing approaching the US 22 interchange.

The LOS for key arterial routes in the SELL study area are as follows:

- SC 544 in Alternative 16 between US 17 and US 501 is predicted to continue to generally operate at LOS F with some higher V/C ratios than in the other alternatives that do not incorporate widening along SC 544. The Alternative 16 V/C is comparable to the Alternative 14 and Alternative 15 V/C along SC 544. Similar to Alternatives 14 and 15, the proposed widening of SC 544 in Alternative 16 attracts sufficient traffic that, even with the additional capacity, traffic volumes will increase such that the overall V/C will be higher.
- Compared to Alternatives 14 and 15, US 501 in Alternative 16 is generally expected to experience higher V/C from SC 544 to El Bethel Road/Conway Perimeter Road and is anticipated to operate at LOS E or LOS F. The higher V/C on these segments is due to the removal of the new alignment connectors that ran parallel to this portion of US 501 and were connected to the Conway Perimeter Road. From El Bethel Road/Conway Perimeter Road, US 501 has slightly lower V/C compared to Alternatives 14 and 15. The V/C for Alternative 16 is also similarly comparable to Alternatives 7 and 8&9, which do not include the additional capacity incorporated into Alternative 15.
- In Alternative 16, El Bethel Road/Conway Perimeter Road no longer connects new alignments that provide additional capacity on a route parallel to US 501. LOS on these segments are comparable to the new alignment alternatives that also did not incorporate a connection to these roads. LOS is anticipated to be LOS C or better in Alternative 16.

In Alternative 16, roadway segments along both US 701 and US 378 generally are expected to operate at LOS F throughout the SELL study area towards Conway Perimeter Road.

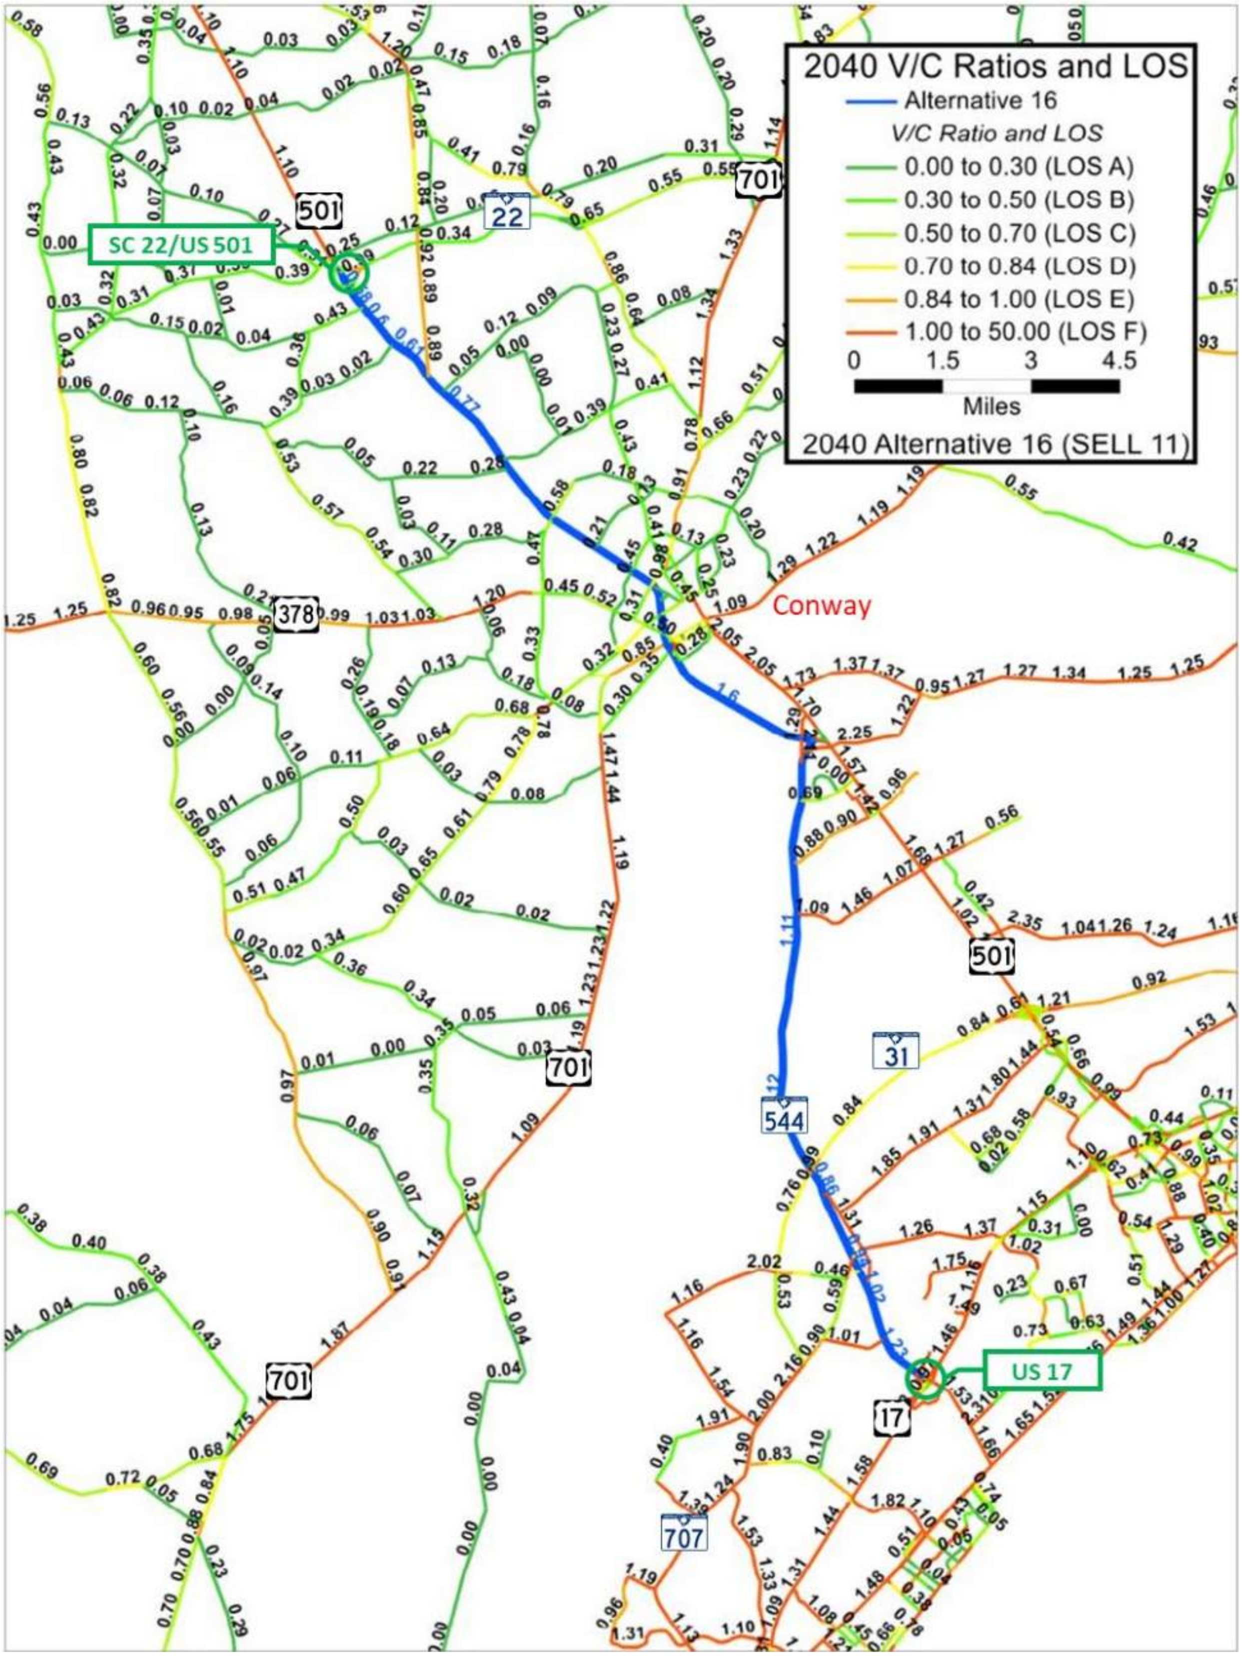

Figure 39 - Alternative 16 V/C and LOS

6.3 Traffic Diversion from Adjacent or Parallel Routes

The diversion of traffic from selected existing roadway links within the GSATS model was evaluated for several of the SELL alternative alignments. The evaluation looked at new SELL alignments based on their geographic location within the SELL study area and looked at the change in 2040 daily volume for the selected existing network segments compared to the 2040 E+C (No-Build) volume assignments on the same links.

For example, since the northern terminus of all the proposed SELL alternatives incorporating roadway facilities on new alignment (Alternatives 1 through 13) is at the US 501/US 22 interchange, it could reasonably be assumed that some level of traffic may be diverted from US 501, resulting in reduced traffic volumes compared to the no-build condition.

The following tables were created to aid in assessing the percentage trip diversion from key existing roadway segments. The rows highlighted in light blue in the tables are the SELL alignment links and their respective volume forecasts. The unhighlighted columns are the SELL alternatives in which the southern terminus occurs on US 17 Bypass (Alternatives 1, 2, 3&5, 4&6, 10&11, and 12&13). The two light yellow highlighted columns are the SELL alternatives that begin at SC 31 (Alternatives 7 and 8&9). The three light orange highlighted columns are the SELL alternatives that incorporate improvements to existing roadways with short or no new alignment roadways (Alternatives 14-16).

Table 8 shows the percentage change of selected US 501 segments compared to their no-build assignment volumes. The three sets of SELL volumes are associated with the various SELL alignment alternatives and are for comparison purposes. The US 501 links were selected for comparison against their no-build volumes.

6.3.1 US 501 South of the US 22 Interchange

For the SELL alternatives that have a southern terminus on US 17 Bypass (Alternatives 1, 2, 3&5, 4&6, 10&11, and 12&13), the reduction of traffic on US 501 south of the US 22 interchange ranges from 14.6 to 19.1 percent. The greatest reduction in traffic on this section of US 501 occurs in the SELL alternatives that begin at SC 31 (Alternatives 7 and 8&9). Due to these routes being closer to US 501, the reduction in traffic on US 501 south of the US 22 interchange is approximately 50 to 100 percent higher than the other alternatives, with about a 31 percent decrease in traffic projected for this section of US 501 compared to the no-build condition. Alternatives 14-16 all incorporate the capacity of this section of US 501 being increased by two lanes. This results in approximately a 30 to 43 percent increase in traffic along this segment of US 501, with the largest increase occurring in Alternative 14, which provides a direct connection from SC 544 to US 501 via the Conway Perimeter Road.

6.3.2 US 501 at El Bethel Road/Conway Perimeter Road

The links on either side of where El Bethel Road/Conway Perimeter Road intersects US 501 are included in **Table 8**. For Alternatives 1, 2, 3&5, 4&6, 10&11, and 12&13, the percentage diversion of traffic from US 501 to the SELL alignments is slightly lower than the segment just south of the US 22 interchange (about 12-13 percent north of El Bethel Road and about seven to nine percent south of El Bethel Road). For Alternatives 7 and 8&9, the diversion from US 501 is higher (between 17 and 21 percent north of El Bethel Road and 16 to 19 percent south of El Bethel Road). For Alternatives 14 and 15, which make use of El Bethel Road/Conway Perimeter Road,

traffic on US 501 is much higher (55 to 64 percent) north of the connection and lower (about 23 to 29 percent) south of the connection. This difference is due to the use of El Bethel Road/Conway Perimeter Road as an element of Alternatives 14 and 15.

For Alternative 16, which includes two additional lanes on US 501 compared to the no-build geometry, the volumes on US 501 on either side of El Bethel Road/Conway Perimeter Road are expected to increase over the no-build volume by almost 50 percent to the north and by 40 percent to the south of the connection.

6.3.3 US 501 East of the US 701 Interchange

US 501 east of the US 701 interchange is projected to experience about a ten percent reduction in traffic volume (compared to no-build volumes) along this portion of US 501 in Alternatives 1, 2, 3&5, 4&6, 10&11, and 12&13. Alternatives 7 and 8&9 are projected to result in an approximately 27 percent reduction along the same section of US 501. Alternative 14 is expected to divert approximately 32 percent of the traffic from US 501 due to the connector between SC 544 and Conway Perimeter Road. Alternative 16 is expected to draw a 42 percent increase in traffic as a result of the two additional lanes of capacity provided on US 501.

These US 501 links east of the US 701 interchange are also adjacent to the SELL 15 connector intersection that is summarized in **Table 10** and are described below. In Alternative 15, US 501 west of the SELL 15 connector intersection is predicted to experience a reduction in traffic of about 36 percent as traffic is diverted from US 501 to the connector and the Conway Perimeter Road. East of the SELL 15 connector, traffic is predicted to increase by about 55 percent as a result of the connector roadway and the two additional lanes of capacity provided on US 501 between SC 544 and the connector.

Table 9 on the previous page shows the percentage change of forecast traffic volumes on selected SC 544 and SC 31 segments on either side of where Alternatives 7 and 8&9 intersect those routes.

6.3.4 SC 544 at Alternative 7 and 8&9

Unlike Alternatives 7 and 8&9, Alternatives 1, 2, 3&5, 4&6, 10&11, and 12&13 do not cross SC 544. However, traffic volumes on SC 544 in the vicinity of where Alternatives 7 and 8&9 would cross SC 544 were still examined to see the extent of traffic diversion from SC 544 that would occur under Alternatives 1, 2, 3&5, 4&6, 10&11, and 12&13. For these alternatives, the reduction of traffic on US 544 in this area was approximately 14 percent.

Alternatives 7 and 8&9 split SC 544 where it intersects. South of the interchange, Alternatives 7 and 8&9 result in a traffic increase of approximately 12 percent on SC 544 compared to the no-build volumes as traffic from the south is attracted to the SELL alternative. North of the interchange, traffic on SC 544 is predicted to decrease between ten and 12 percent. This reduction is due to the diversion of through traffic from SC 544 to these SELL alternatives.

Alternatives 14, 15, and 16 incorporate two additional lanes of capacity on SC 544. In these alternatives, the increase in capacity is forecast to increase traffic on SC 544 in the vicinity of where Alternatives 7 and 8&9 cross by between about 45 to 55 percent.

6.3.5 SC 31 at Alternative 7 and 8&9

The southern terminus of SELL Alternatives 7 and 8&9 is located on SC 31 (Carolina Bays Parkway) between the US 501 and SC 544 interchanges. Alternatives 1, 2, 3&5, 4&6, 10&11, and 12&13 are predicted to create a minor reduction (up to three percent compared to the no-build volumes) in traffic on SC 31 with these Alternatives. Alternatives 7 and 8&9 are predicted to result in a small reduction (up to about two percent) in traffic on SC 51 west of the terminus for these alternatives, but are predicted to increase traffic on SC 31 east of the proposed southern terminus of these alternatives by about 31 percent. This increase in traffic is attracted to the proposed SELL alternatives as a shorter time connection to the interchange at SC 501 and US 22 and for other destinations in between.

Alternatives 14, 15, and 16, which incorporate two additional lanes of capacity on SC 544, do not include any capacity changes on SC 31. The additional capacity on SC 544 from these alternatives is predicted to result in a slight increase (between two and three percent) in traffic volumes on SC 31 compared to the no-build volumes.

Table 10 shows the percentage change of forecast traffic volumes on selected SC 544 and US 501 segments where the new alignment segments in Alternatives 14 and 15 are located. In Alternative 14, a new alignment connection is provided between SC 544 and the Conway Perimeter Road. In Alternative 15, a connection is provided from US 501 to the Conway Perimeter Road that incorporates the western part of the Alternative 14 connection.

6.3.6 SC 544 at Alternative 14

SC 544 in the vicinity of the SELL 14 connector intersection is projected to experience a 13 to 14 percent reduction in traffic volume (compared to no-build volumes) as part of Alternatives 1, 2, 3&5, 4&6, 10&11, and 12&13. Alternatives 7 and 8&9 are expected to provide a greater reduction of traffic along this section of SC 544 (between 31 and 34 percent) as a result of the location of these alternative alignments and their proposed interchanges with SC 544 drawing traffic away from SC 544.

In Alternative 14, traffic on SC 544 south of the connector is projected to increase by approximately 64 percent because of the additional two lanes of capacity and the connection to Conway Perimeter Road. North of the connector towards US 501, about 20 percent of the traffic is expected to be diverted from SC 544 to the new connector. In Alternatives 15 and 16 which do not include the connection to SC 544, traffic is predicted to increase by about 45 and 43 percent respectively. This is attributable to the additional two lanes of capacity on SC 544.

Alternative 14 is expected to divert approximately 32 percent of the traffic from US 501 due to the connector between SC 544 and Conway Perimeter Road.

6.3.7 US 501 at Alternative 15

US 501 in the vicinity of the SELL 15 connector intersection is projected to experience about a ten percent reduction in traffic volume (compared to no-build volumes) along this portion of US 501 in Alternatives 1, 2, 3&5, 4&6, 10&11, and 12&13. Alternatives 7 and 8&9 are projected to result in an approximately 27 percent reduction along the same section of US 501.

In Alternative 15, US 501 west of the SELL 15 connector intersection is predicted to experience a reduction in traffic of about 36 percent as traffic is diverted from US 501 to the connector and the Conway Perimeter Road.

% change from No-Build	-	-10.1%	-9.5%	-10.0%	-9.2%	-26.4%	-27.6%	-9.4%	-8.8%	-32.1%	54.6%	42.0%

East of the SELL 15 connector, traffic is predicted to increase by about 55 percent as a result of the connector roadway and the two additional lanes of capacity provided on US 501 between SC 544 and the connector.

Alternative 16, which has no connector, but includes two lanes of additional capacity along US 544 and US 501, is predicted to attract approximately 42 percent more traffic compared to the no-build volumes to this section of US 501.

6.4 Average Travel Time to US 501/SC 22 Interchange

The average travel times for the SELL alternatives between two locations near US 17 Bypass near the termini of the new alignment routes and US 501 north of the SC 22 interchange were prepared from the individual alternative model runs. **Figure 40** illustrates the locations of the two starting points and the termination point with respect to the alignment of Alternative 16 (SELL 11). The locations are:

- SC 544 south of the US 17 Bypass (at node #5002430 at the intersection of SC 544 and Beaver Run Road - shown with a **green star**)
- Holmestown Road south of US 17 Bypass (at node #5002398 at the intersection of Holmestown Road and Hopkins Circle - shown with a **blue star**)
- US 501 north of the SC 22 interchange (at node #5000586 at the intersection of US 501 and Bunson Spring Road/Horry Road – shown with a **red star**).

Table 11 summarizes the 2040 free flow travel times, and AM and PM peak hour congested travel times between the termini for each alternative, including the no-build alternative, as estimated by the model.

Table 11 - Travel Time between US 17 Bypass and US 501/SC 22 Interchange

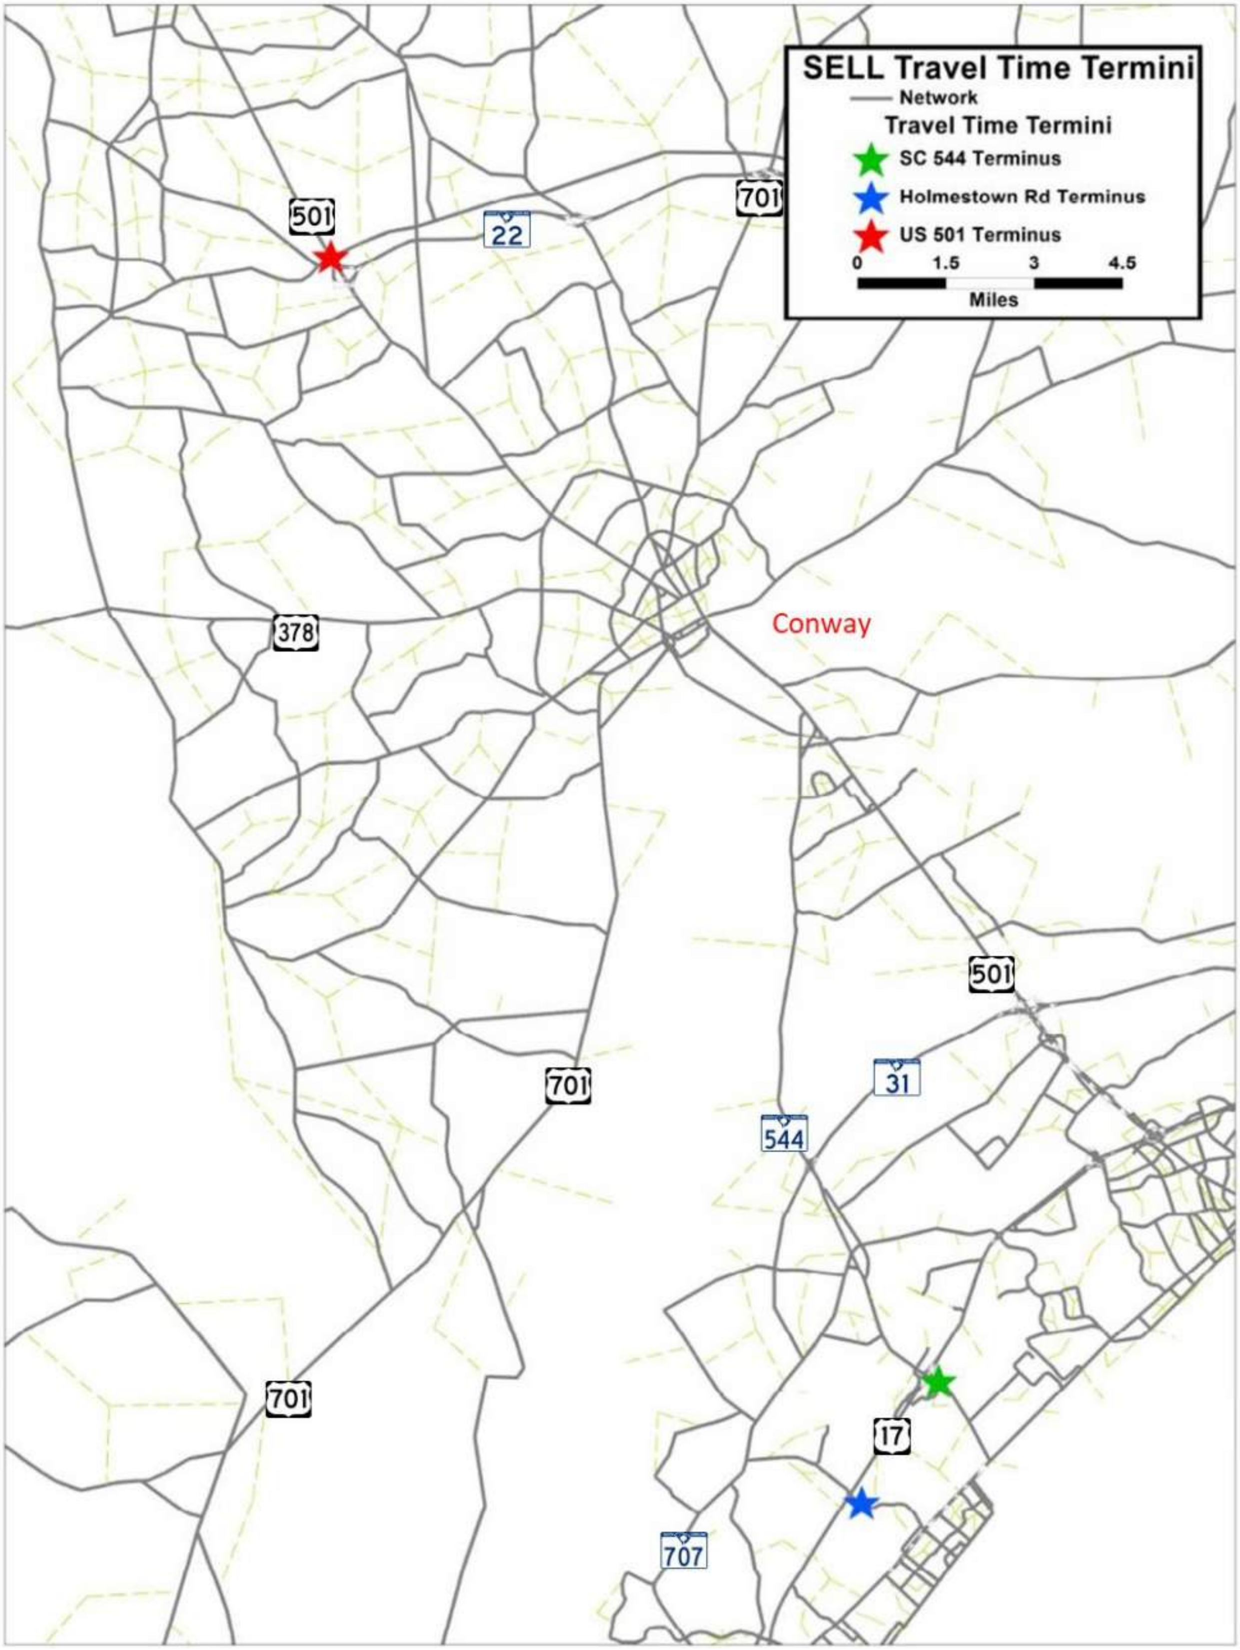

Figure 40 - Travel Time Termini

6.5 Travel Time Profiles

Travel Time profiles can be useful in visually depicting how much distance can be covered over certain periods of time within a certain region. Peak period travel time profiles were developed for the AM and PM peak period periods for the SELL alternatives as a way of visually comparing travel times within the network starting at a common point. The Travel Time bands in the profiles were provided in five-minute increments.

All SELL alternatives do not share the same southern terminus, which would affect direct comparisons of the travel times profiles starting at each alternative's southern terminus. For example, the southern terminus of Alternatives 1, 3&5, and 10&11 begins at US 17 Bypass at Holmestown Road. The southern terminus of Alternatives 2, 4&6, and 12&13 begins to the west of Holmestown Road on US 17 Bypass. The southern terminus of Alternatives 7 and 8&9 begin on SC 31 between the interchanges for US 501 and SC 544. The three alternatives consisting of most or all existing arterials with additional capacity all assume a southern terminus of SC 544 at US 17 Bypass.

For the purposes of developing comparable travel time profiles, a common starting point at SC 544 south of the US 17 Bypass at the intersection of SC 544 and Beaver Run Road was selected to create one set of travel time profiles for the SELL alternatives. This location is consistent with one of the starting points for the travel times from US 17 Bypass to US 501 north of the SC 22 interchange summarized in **Table 11**.

The travel time profile figures are contained in **Appendix J**.

7 Conclusions

The 2040 GSATS model was obtained for use in the analysis of potential SELL alternatives, which were developed from sixteen original alternative alignments. Five pairs of the sixteen individual alternative alignments had segments that differed only slightly that one of the pair of alternatives would reasonably represent both alternatives in the GSATS model, reducing the number of SELL alternatives to be modeled in the GSATS model from sixteen to eleven.

Eight of the modeled eleven SELL alternatives consisted of primarily new alignments (Alternatives 1 through 13). Two of the SELL alternatives consisted of a combination of new segments and improvements to existing network segments (Alternatives 14 and 15). One alternative had no new segments and consisted entirely of improvements made to existing network segments (Alternative 16).

Six of the eight new alignment SELL alternatives had southern termini at US 17 Bypass and incorporated interchanges on SC 707, US 701, and US 378. The other two new alignment SELL alternatives begin at SC 31 and incorporate interchanges at SC 544, US 701, and US 378. All eight new alignment SELL alternatives terminate at a modified interchange at US 501 and SC 22.

The eight new alignment SELL alternatives (Alternatives 1 through 13) are predicted to operate at LOS C or better in 2040 except for the Alternatives 7 and 8&9 that begin on SC 31. The six-lane section between SC 544 and US 701 is projected to operate at LOS F. To improve this future LOS, eight lanes would need to be provided.

The eleven SELL alternatives were coded into the GSATS model and the model run to generate traffic forecasts. In addition to traffic forecasts on the links, turning movement forecasts were also developed to provide insight regarding the number of turn lanes that may be needed at ramp termini and intersections.

A series of MOE were extracted from the traffic forecasts for the eleven SELL alternatives and the No-Build condition, which was based on the 2040 Existing plus Committed GSATS model network. These MOE included VMT, VHT, travel time, speed, and V/C. The V/C were used to assign a LOS to each segment.

The estimated average volume on the eight new alignment SELL alternatives range between 32,700 and 45,100 vehicles per day. The estimated average volume on the three alignments making use of most or all of SC 544, Conway Perimeter Road and US 501 are projected to range between 50,300 and 52,500 vehicles per day.

Of the eight new alignment SELL alternatives, the estimated VMT on those routes range from about 876,000 and 1,133,000 vehicle miles traveled. The estimated VMT on the three alignments making use of SC 544, Conway Perimeter Road and US 501 are projected to range between 1,180,000 and 1,220,000 vehicle miles traveled.

Of the eight new alignment SELL alternatives, the estimated VHT on those routes range from about 15,300 and 18,600 vehicle hours traveled. The estimated VHT on the three alignments making use of SC 544, Conway Perimeter Road and US 501 are projected to range between 39,300 and 53,600 vehicle hours traveled.

Congested travel times measured from two locations south of US 17 Bypass to US 501 north of the US 501 interchange at Bunson Spring Road/Horry Road. From the first location (SC 544 at Beaver Run Road), the AM peak congested travel times were estimated to range from 29.9 to 37.4 minutes for the eight new alignment alternatives (compared to 44.2 minutes for the No-Build condition). The estimated congested AM travel times for the three alignments making use of SC 544, Conway Perimeter Road, and US 501 are estimated to range between 28.9 and 33.7 minutes. The PM peak congested travel times for the eight new alignment alternatives were estimated to range from 56.4 to 67.5 minutes (compared to 115.3 minutes for the No-Build condition). The estimated PM congested travel times for the three alignments making use of SC 544, Conway Perimeter Road, and US 501 are estimated to range between 66.6 to 88.4 minutes.

From the second location (Holmestown Road at Hopkins Circle), the AM peak congested travel times were estimated to range from 29.2 to 37.4 minutes for the eight new alignment alternatives (compared to 51.2 minutes for the No-Build condition). The estimated congested AM travel times for the three alignments making use of SC 544, Conway Perimeter Road, and US 501 are estimated to range between 36.3 and 41.2 minutes. The PM peak congested travel times for the eight new alignment alternatives were estimated to range from 39.3 to 84.6 minutes (compared to 129.1 minutes for the No-Build condition). The estimated PM congested travel times for the three alignments making use of SC 544, Conway Perimeter Road, and US 501 are estimated to range between 98.0 to 119.0 minutes.

Within the SELL study area, the eight new alignment SELL alternatives are estimated to increase VMT between 9.0 and 10.6 percent. The three alternatives that make use of improvements along the existing arterials of SC 544 and US 501 are estimated to increase VMT in the SELL study area between 4.3 and 6.4 percent. VHT in the SELL study area is estimated to be reduced by approximately 1.9 and 5.1 percent with the eight new alignment SELL alternatives, and between 1.7 and 4.7 percent for the three alternatives that make use of SC 544 and US 501.

The travel demand modeling has generated useful information to continue investigating the feasibility of the Alternatives.

Executive Summary

This report summarizes a series of analyses performed for sixteen SELL alternatives.

Thirteen of the SELL alternatives (Alternatives 1 – 13) are alternatives on new alignments between the US 501/SC 22 interchange and termini on either US 17 or SC 31.

Three of the SELL alternatives (Alternatives 14 – 16) make extensive use of widened existing routes, including SC 544, US 501, and the Conway Perimeter. Two of these alternatives (Alternatives 14 and 15) include portions that are located on new alignment, while one alternative (Alternative 16) has no new alignment sections.

The analyses were based on traffic volumes derived from forecast turning movements from the 2040 GSATS travel demand model. It should be noted that as continuing development and refinement of the project alternatives proceeds, actual traffic data will be necessary to validate the volumes derived from the travel demand model forecasts.

Analyses were performed to evaluate the operation of the freeway segments, merge/diverge areas, and weaving sections of the new alignment alternatives (Alternatives 1 - 13). The results of the analyses indicated the elements all operated at LOS C or better, with the exception of the SC 544 northbound merge area in the PM design hour in Alternative 7, which operated at LOS D.

Service interchange concepts for the new alignment alternatives (Alternatives 1 - 13) and their associated interchange arterial roadways were evaluated. The method of analysis used provided expected operational levels of service where traffic control was present. Levels of service could not be obtained for directional ramps without traffic control.

The service interchanges evaluated for the new alignment alternatives (Alternatives 1 – 13) consisted of interchanges at

- SC 707 (Alternatives 1 – 6 and Alternatives 10 – 13)
- US 701 (Alternatives 1 – 13)
- US 378 (Alternatives 1 - 13)
- that consisted of all directional ramps

Stop sign traffic control was assumed at service interchange intersections where traffic control was required. All the service interchange ramp intersections with stop sign control are expected to operate at LOS D or better with the exception of the southbound off-ramp to the US 378 interchanges. Traffic signal control at this intersection may be required to improve the expected operational level of service.

Service interchanges consisting entirely of directional ramps in Alternatives 1 – 13 could not be analyzed without using complex microsimulation software that was outside the scope of the alternative concept development. These interchanges included:

- US 17 at the terminus of Alternatives 2, 4, 6, 12, and 13.
- SC 31 at the terminus of Alternatives 7, 8 and 9
- SC 544 in Alternatives 7, 8, and 9
- US 501/SC 22/SELL in Alternatives 1 to 13.

In the three alternatives making extensive use of existing roadway facilities (Alternatives 14 – 16), analyses were not performed for major intersections along the proposed widened roadways due to an absence of existing intersection turning movement volume data. The analyses performed was limited to assisting in the development of ramp concepts as follows:

- The proposed flyover ramp from northbound SC 544 to new alignment Segment O in Alternative 14
- The proposed flyover ramp from westbound US 501 to new alignment Segment M in Alternative 15
- The proposed ramp from eastbound US 501 to southbound SC 544 Overpass in Alternatives 15 and 16.

1 Introduction

STV, in cooperation with CECS, has been contracted by the South Carolina Department of Transportation (SCDOT) to analyze the Southern Evacuation Lifeline (SELL) alternative concepts. This analysis is based on roadway alternative concepts and estimated 2040 build traffic volumes developed as part of the travel demand modeling effort summarized in the *Travel Demand Modeling Technical Report* prepared by STV in May 2022. The *Travel Demand Modeling Technical Report* has an extensive overview of the study area, projected growth, and information on the development of Alternatives and their volumes. The report summarized the preparation of traffic forecasts using the 2040 Grand Strand Area Transportation Study (GSATS) travel demand model. Those traffic forecasts have been further developed to provide estimated morning and afternoon design hour volumes (DHV). The DHV are estimated peak hour volumes derived from the GSATS model traffic forecasts of peak period volumes using observed percentages of peak hour volumes within comparable peak periods based on SCDOT count station data. The DHV were developed for use in planning-level analyses for the arterials, freeway segments, merge and diverge areas for on- and off-ramps, and weaving sections as outlined in this report. The number of lanes for the various alternatives were developed based on these DHV and volume-capacity ratios reported by the GSATS model.

Preliminary alternative analyses were performed using methodologies and techniques derived from the Highway Capacity Manual (HCM) 6th Edition as incorporated into McTrans' HCS7 (HCS), Build 7.8.5, to evaluate the alternatives for the proposed Southern Evacuation Lifeline (SELL) project. An initial generalized set of HCS runs for freeway segments, merge and diverge areas, and weaving segments for the 13 new alignment alternatives with new roadway alignment (Alternatives 1 through 13) were done in June 2022. Since then, revised conceptual designs for the 13 new alignment alternatives were developed. The revised designs incorporated refinements to more generalized assumptions, such as acceleration and deceleration lane lengths and types of tapers, resulting in this final analysis.

The new alignment alternatives begin at an expanded interchange at US 501 and SC 22 (Conway Bypass) with the southern end located either along US 17 near Surfside Beach or along SC 31 (Carolina Bays Parkway) at a point between SC 544 and US 501.

Three other alternatives make use of expanded existing roadways. The northern end of these alternatives begins on US 501 at the SC 22 interchange with the southern end of these alternatives located on SC 544 at US 17 Bypass. These alternatives include portions of US 501 and/or portions of the Conway Perimeter Road. Two of the alternatives incorporate short sections of new alignment connections between existing roadways. These three arterial alternatives do not incorporate new freeway sections or interchange concepts. Since the primary purpose of the analysis is to evaluate new alignment freeway sections and interchange alternatives, the detailed microsimulation analyses that would be needed at the a-grade intersections along these existing arterials are not included in this report.

This Alternatives Concept Analysis Report will:

- Discuss the development of the DHV from the GSATS model forecasts.
- Describe the interchange configurations for each of the new alignment SELL alternatives.
- Depict the DHV 'turn movement' forecasts for each new alignment alternative.
- Summarize HCS capacity analysis results for the individual new alignment SELL alternatives.

- Summarize the analysis of interchange arterial ramp termini intersections.
- Describe the interchange configuration and expected operation for the alternatives incorporating existing roadways.

1.1 SELL Study Area

As noted in the *Travel Demand Modeling Technical Report*, the SELL project area is a subset of the current GSATS travel demand model, which was released for use in late 2016 in support of the 2040 Metropolitan Transportation Plan. The model incorporates all of Georgetown and Horry counties in South Carolina and portions of Brunswick County in North Carolina. The study area for the SELL project is a portion of the overall GSATS model and is generally located in southwest Horry County in an area bounded by the Georgetown County line, US 17, SC 544, and US 501. The northern terminus of the SELL project is the existing interchange of US 501 and the Conway Bypass (SC 22).

The SELL study area in the context of the GSATS region is shown in **Figure 1.1**.

A review of the sixteen alternative concepts indicated that there were alternatives which were largely identical except for one or several segments that were not likely to impact the capacity analysis. In these cases, one alternative was selected to represent the two similar alternatives. A further review of the conceptual new alignment alternatives prior to the analysis indicated the interchange configurations, acceleration and deceleration lane lengths and tapers in the similar alternatives were identical. This essentially reduced the total number of alignment alternatives analyzed from 16 total conceptual alternatives to the following 11 SELL alternatives:

- Alternative 1 -> SELL 01
- Alternative 2 -> SELL 02
- Alternative 3 & Alternative 5 -> SELL 03
- Alternative 4 & Alternative 6 -> SELL 04
- Alternative 7 -> SELL 05
- Alternative 8 & Alternative 9 -> SELL 06
- Alternative 10 & Alternative 11 -> SELL 07
- Alternative 12 & Alternative 13 -> SELL 08
- Alternative 14 -> SELL 09
- Alternative 15 -> SELL 10
- Alternative 16 -> SELL 11

As shown above, Alternatives 1 – 13, which are the new alignment alternatives, can be combined into eight alternatives. The remaining three alternatives, Alternatives 14 – 16 are the alternatives primarily making use of existing arterial roadways instead of new freeway alignments.

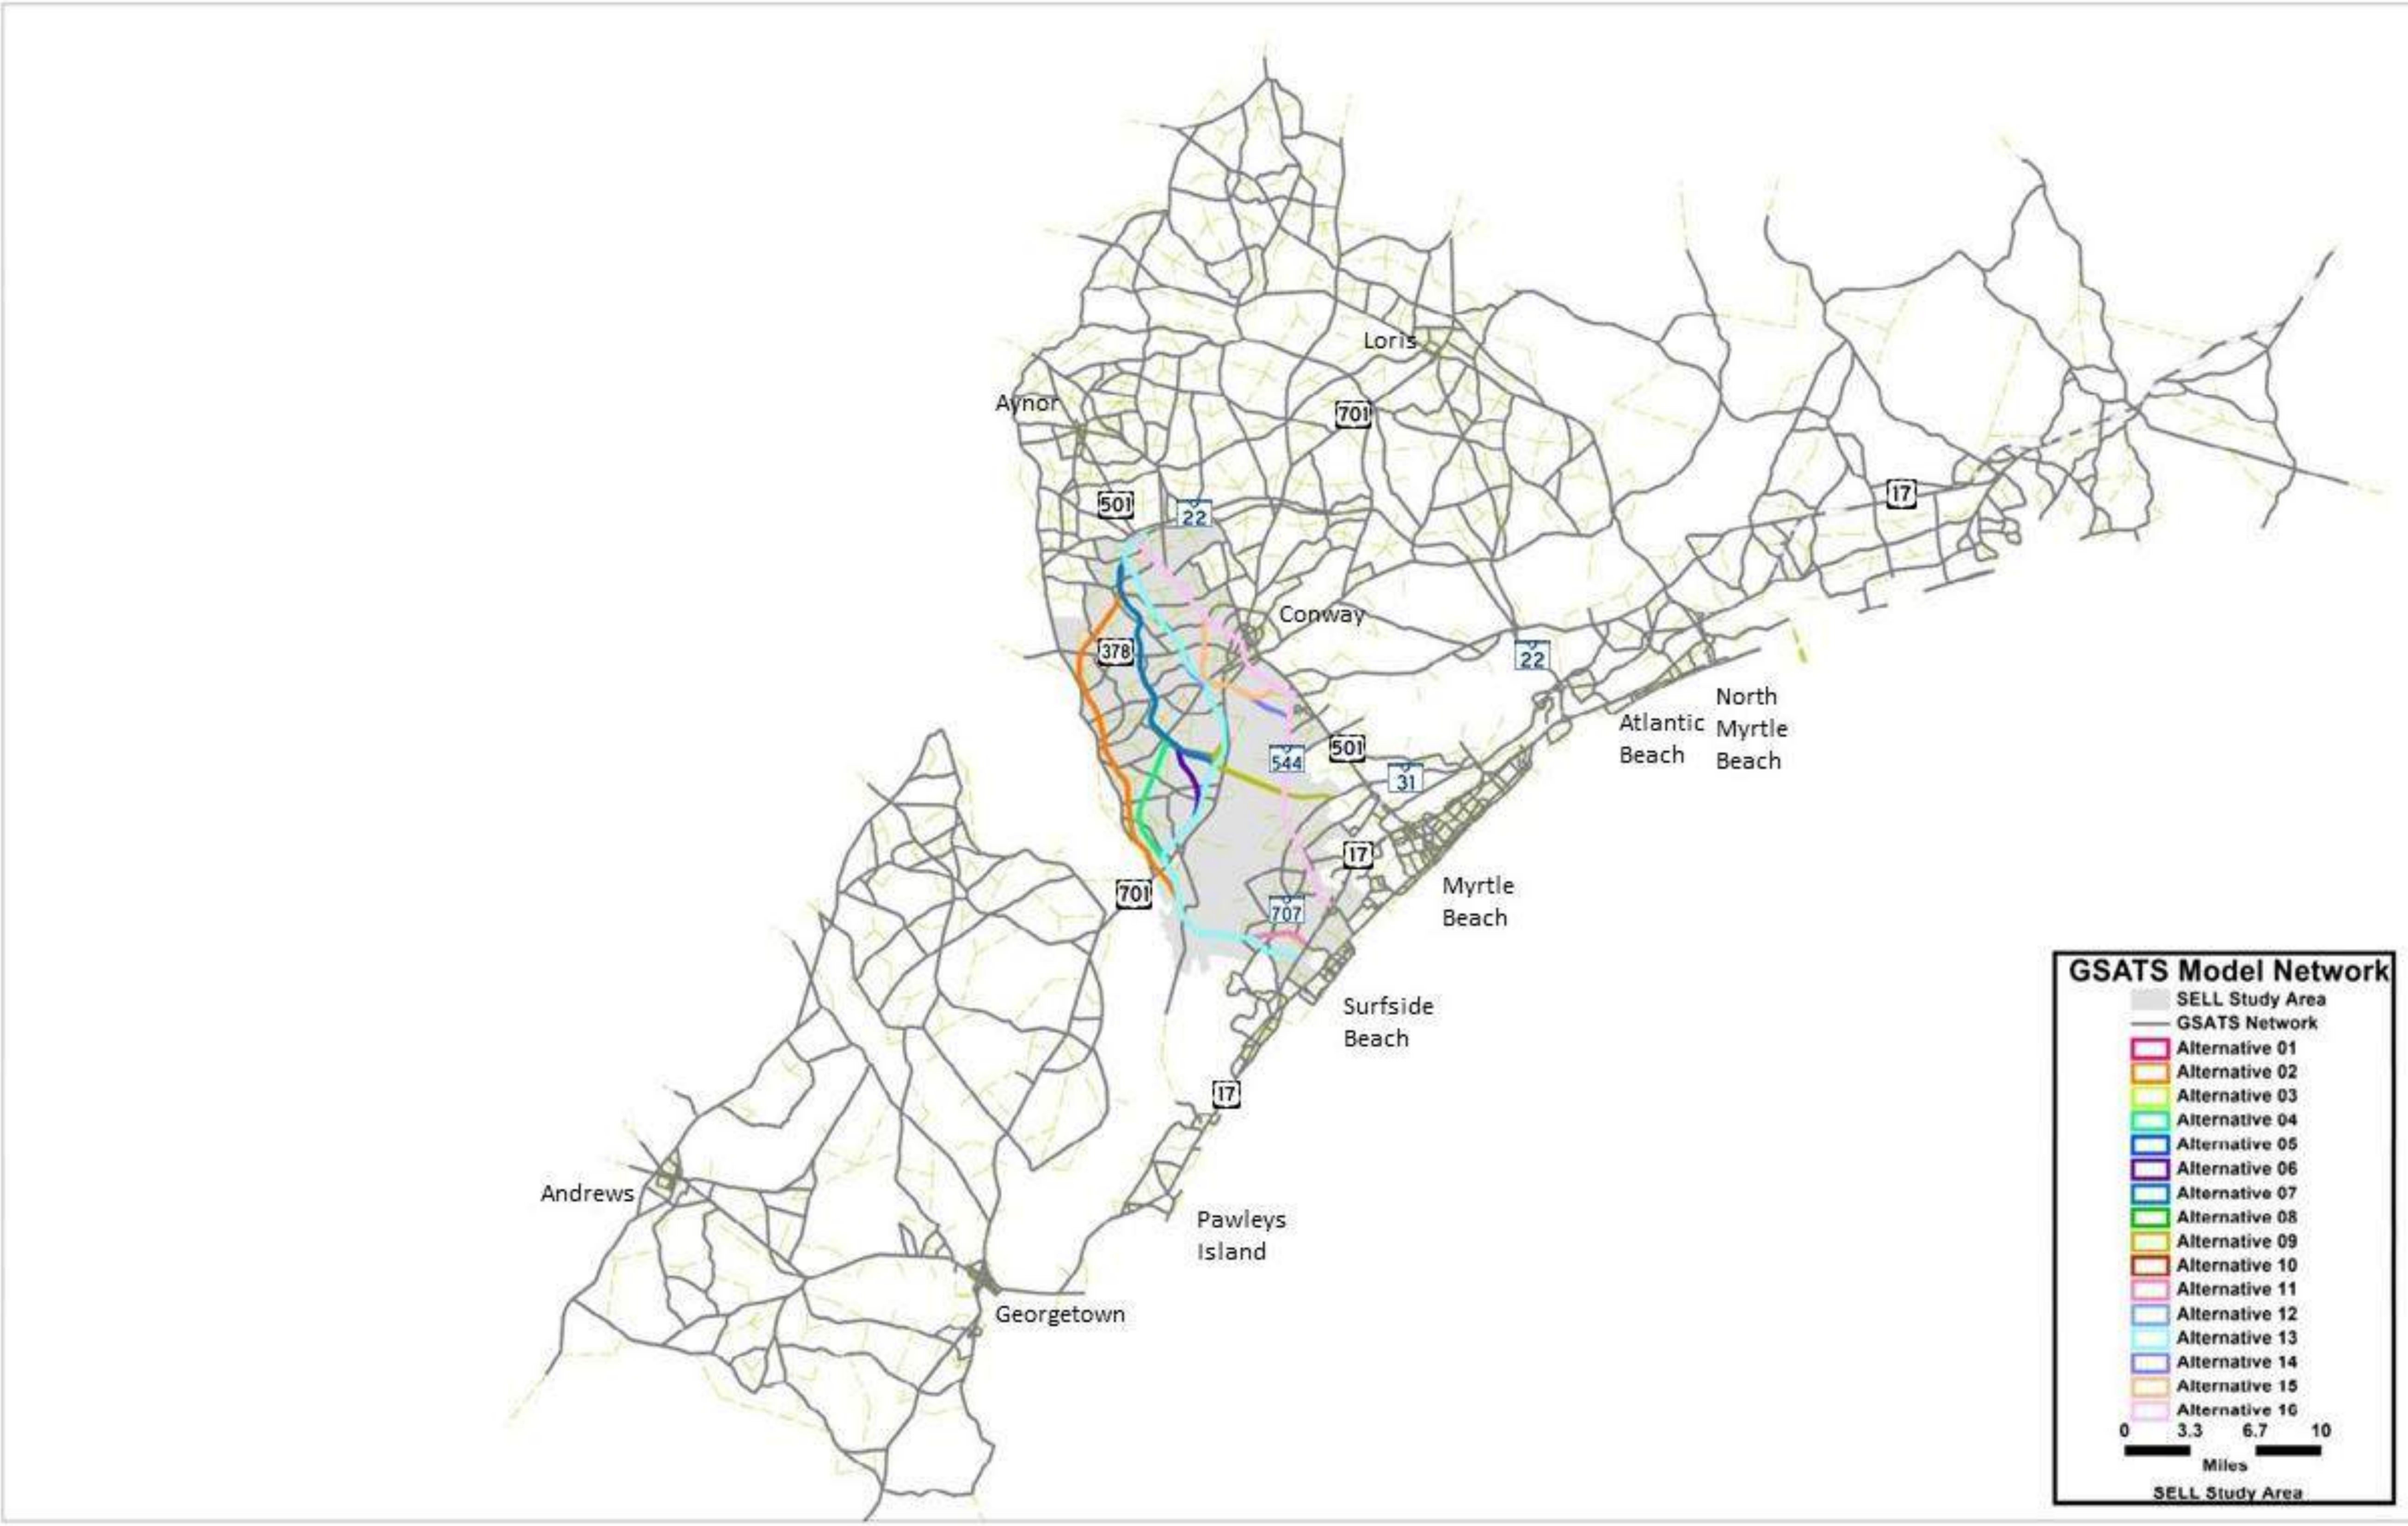

Figure 1.1 - SELL Study Area within GSATS Region

2 Development of DHV

The Travel Demand Modeling effort summarized in the *Travel Demand Modeling Technical Report* produced a range of output files for each alternative run, including daily and peak period traffic volumes and intersection flows. For the purposes of this analysis, which requires the use of hourly volumes, the peak period traffic volumes and intersection flows had to be converted to design hour flows along the mainline segments and at the proposed SELL interchange locations. While the accuracy of the intersection flow generated by travel demand models is limited, they can be useful in developing the preliminary size and configuration of proposed interchanges, as well as provide insight into the number of turn lanes that might be needed at ramp termini and at intersection locations.

The *GSATS Model Calibration Report* defines the morning peak period as occurring between 6:00 to 9:00 AM. The afternoon peak period is defined as occurring between 3:00 to 6:00 PM. The process of converting the morning and afternoon peak period volume forecasts obtained from the model runs to morning and afternoon peak hour design volumes was initiated by collecting and reviewing Continuous Count Station (CCS) Data obtained from SCDOT's traffic count station website https://scdottrafficdata.drakewell.com/publicmultinodemap.asp. The CCS data includes two-way volumes, directional volumes, and directional volume by lane. The volume data are provided in hourly increments for each day, with summaries provided for each day for various time periods. The AM and PM peak hours and volumes are also identified for each day. For each month, hourly volumes for workdays (non-weekends and holidays) are provided, as are weekly average volumes and the total monthly volume.

A review of the CCS locations within the SELL study area was performed to identify the most local available count stations to the new alignment SELL alternatives. Six CCS were identified. Two of these CCS were considered to be the most local available CCS and four were considered but not used. The two CCS used were:

- Station 0066 – SC 544 from the SC 544 Connector (W Cox Ferry Road) to S-814 (Hwy 814)
- Station 0104 – US 501 from SC 22 (Hwy 22) to S-165 (Cultra Road)

The four CCS locations considered that were not used are:

- Station 0105 – US 501 from S-651 (Bill Jones Road), L-651 to SC 22 (HWY 22)
- Station 0082 – SC 22 from US 501 (E Hwy 501) to SC 319 (Hwy 319)
- Station 0134 – US 378 from County Line – Marion to S-134 (Hwy 134)
- Station 0018 – US 501 from SC 544 (Hwy 544 Overpass) to SC 31 (Carolina Bays Parkway)

Station 0104 was considered to be just outside the northern end of the study area. Station 0082 is located on Conway Bypass away from the study area. Station 0134 has low AADT and as an east-west route would not represent the north-south SELL alternatives well. Station 0018 is closer to SC 31 than SC 544 to the southeast of the SELL project area in a much more urbanized area than the location of the new alignment SELL alternatives.

Data from CCS 0066 and 0104 were downloaded from the SCDOT count site. For Station 0104, data was downloaded covering the period from January 2021 through April 2022. For Station 0066, data was downloaded covering the period from January 2021 through January 2022 (data was not available at the time of downloading for February through April 2022).

The downloaded data was reviewed and summarized using the total and directional average daily workday volume and for each of the six peak period hours for each month of data. Using this data, K-factors (representing the percentage of the daily volume) and D-factors (representing the directional split). The resulting K- and D- factors are summarized in **Table 2.1**. It should be noted that the estimated peak period volume assignment from the GSATS model should already incorporate a directional split calculated by the model. The CCS directional split shown in **Table 2.1** was analyzed for use in adjusting, if necessary, the model's estimated directional split.

Table 2.1 - Calculated K- and D-Factors for CCS 066 and 104

Factors	Station 066	Station 104
AM Period K factor	**41.40%**	**38.10%**
PM Period K factor	**34.20%**	**34.10%**
AM EB/NB D factor	**57% (EB)**	**44% (NB)**
AM WB/SB D factor	**43% (WB)**	**56% (SB)**
PM EB/NB D factor	**50% (EB)**	**52% (NB)**
PM WB/SB D factor	**50% (WB)**	**48% (SB)**

Based on the CCS Data summarized in **Table 2.1**, for the purposes of the analysis, a K-factor of 0.40 was applied to the AM peak period volumes to estimate an AM DHV and a K-factor of 0.34 will be applied to the PM peak period volumes to estimate a PM DHV.

The CCS directional split data indicates that during the morning peak hour, 57 percent of existing traffic on SC 544 is oriented eastbound towards US 501, while 56 percent of the traffic on US 501 is oriented to the south. In the afternoon peak hour, traffic on SC 544 is evenly split in each direction, while there is a slight northbound directional flow (52 percent) on US 501.

Summaries of the calculations of the K- and D-factors for CCS 0066 and 0104 are contained in **Appendix A.**

3 Alternatives Analyzed

Roadway Alternatives 1 through 13 (GSATS SELL Alternatives 1 through 8) are all new alignments. Roadway Alternatives 14 and 15 (GSATS SELL Alternatives 9 and 10) are a combination of the new alignments and the existing routes. Roadway Alternative 16 (GSATS SELL Alternative 11) is entirely on existing routes.

The following sections describe the new alignment Alternatives and their interchanges.

All new alignment alternatives end at the Conway Bypass (SC 22) and US 501 interchange. The modifications to that interchange are common in each of the new alignment alternatives. These are:

- A ramp from southbound US 501 to both directions of SELL and SC 22. This ramp will widen to two lanes before separating to westbound/southbound SELL and to the flyover to eastbound SC 22.
- A ramp from northbound/eastbound SELL to northbound US 501. This ramp will join the flyover ramp from southbound US 501 to eastbound SC 22 to create a two-lane section prior to separating to the proposed flyover ramp to US 501 and the existing ramp to eastbound SC 22.
- A ramp from northbound/eastbound SELL to southbound US 501. This ramp will be a lane drop, reducing the SELL alignment from three lanes to two lanes before it continues east as SC 22.

- A loop ramp from northbound US 501 to westbound/southbound SELL. This ramp creates a weaving section between it and the existing loop ramp from westbound SC 22 to southbound US 501.

3.1 Alternative 1

Alternative 1 starts at Conway Bypass and US 501 interchange and runs in the southwest direction until intersecting US 378 one mile east of Pee Dee Highway (S-26-24). The proposed interchange at US 378 is a diamond interchange with a single loop ramp in the northeast quadrant connecting northbound SELL to westbound US 378. Alternative 1 continues in the southeast direction until intersecting US 701 1.5 miles west of Little Lamb Road (S-26-48). The interchange at US 701 is a partial cloverleaf interchange with a loop on-ramp in the northwest quadrant connecting westbound US 701 to southbound SELL, and a loop on-ramp in the southeast quadrant connecting eastbound US 701 to northbound SELL. Alternative 1 continues in the southeast direction until intersecting SC 707 0.6 miles south of Bay Road (S-26-926). At SC 707, a Single Point Urban Interchange (SPUI) is proposed. Alternative 1 proceeds east along the alignment of Holmestown Road until it terminates at the existing grade-separated intersection of US 17 and Glenns Bay Road. The total length of Alternative 1 is 29.3 miles.

Alternative 1 is shown in **Figure 3.1**.

3.2 Alternative 2

Alternative 2 follows the same alignment as Alternative 1 from the Conway Bypass/US 501 interchange until approximately 0.8 miles west of SC 707. At that point, the Alternative 2 alignment continues along a more southern route than Alternative 1. The interchange of Alternative 2 with SC 707 is a proposed Single Point Urban Interchange (SPUI) that is located approximately 4,400 feet south of Holmestown Road. The interchanges along Alternative 2 at US 378 and US 701 are the same as proposed for Alternative 1. The proposed interchange at US 378 is a diamond interchange with a single loop ramp in the northeast quadrant connecting northbound SELL to westbound US 378 and the interchange at US 701 is a partial cloverleaf interchange with a loop on-ramp in the northwest quadrant connecting westbound US 701 to southbound SELL, and a loop on-ramp in the southeast quadrant connecting eastbound US 701 to northbound SELL. Alternative 2 terminates 0.7 miles southwest of the US 17 and Holmestown Road intersection at a directional interchange that incorporates a loop on-ramp from northbound US 17 to northbound SELL. The total length of Alternative 2 is 30.4 miles.

Alternative 2 is shown in **Figure 3.2**.

3.3 Alternative 3&5

The alignments for Alternative 3 and 5 are generally similar. They differ between Pauley Swamp Road and the US 701 interchange, where Alternative 3 follows an alignment generally parallel to, but to the west of, Alternative 5. For the purposes of the analysis, Alternatives 3 and 5 are essentially identical and 'Alternative 3&5' is used to indicate results for these two similar alternatives.

Alternative 3&5 is the same as Alternative 1 from US 501 to just north of where it crosses Pauley Swamp Road (S-26-109). From there, Alternative 3&5 runs generally parallel to the east of Alternative 1, intersecting US 378 approximately three miles east of the Alternative 1 interchange with US 378, approximately 1,500 feet west of

Figure 3.1 - SELL Conceptual Alternative 1

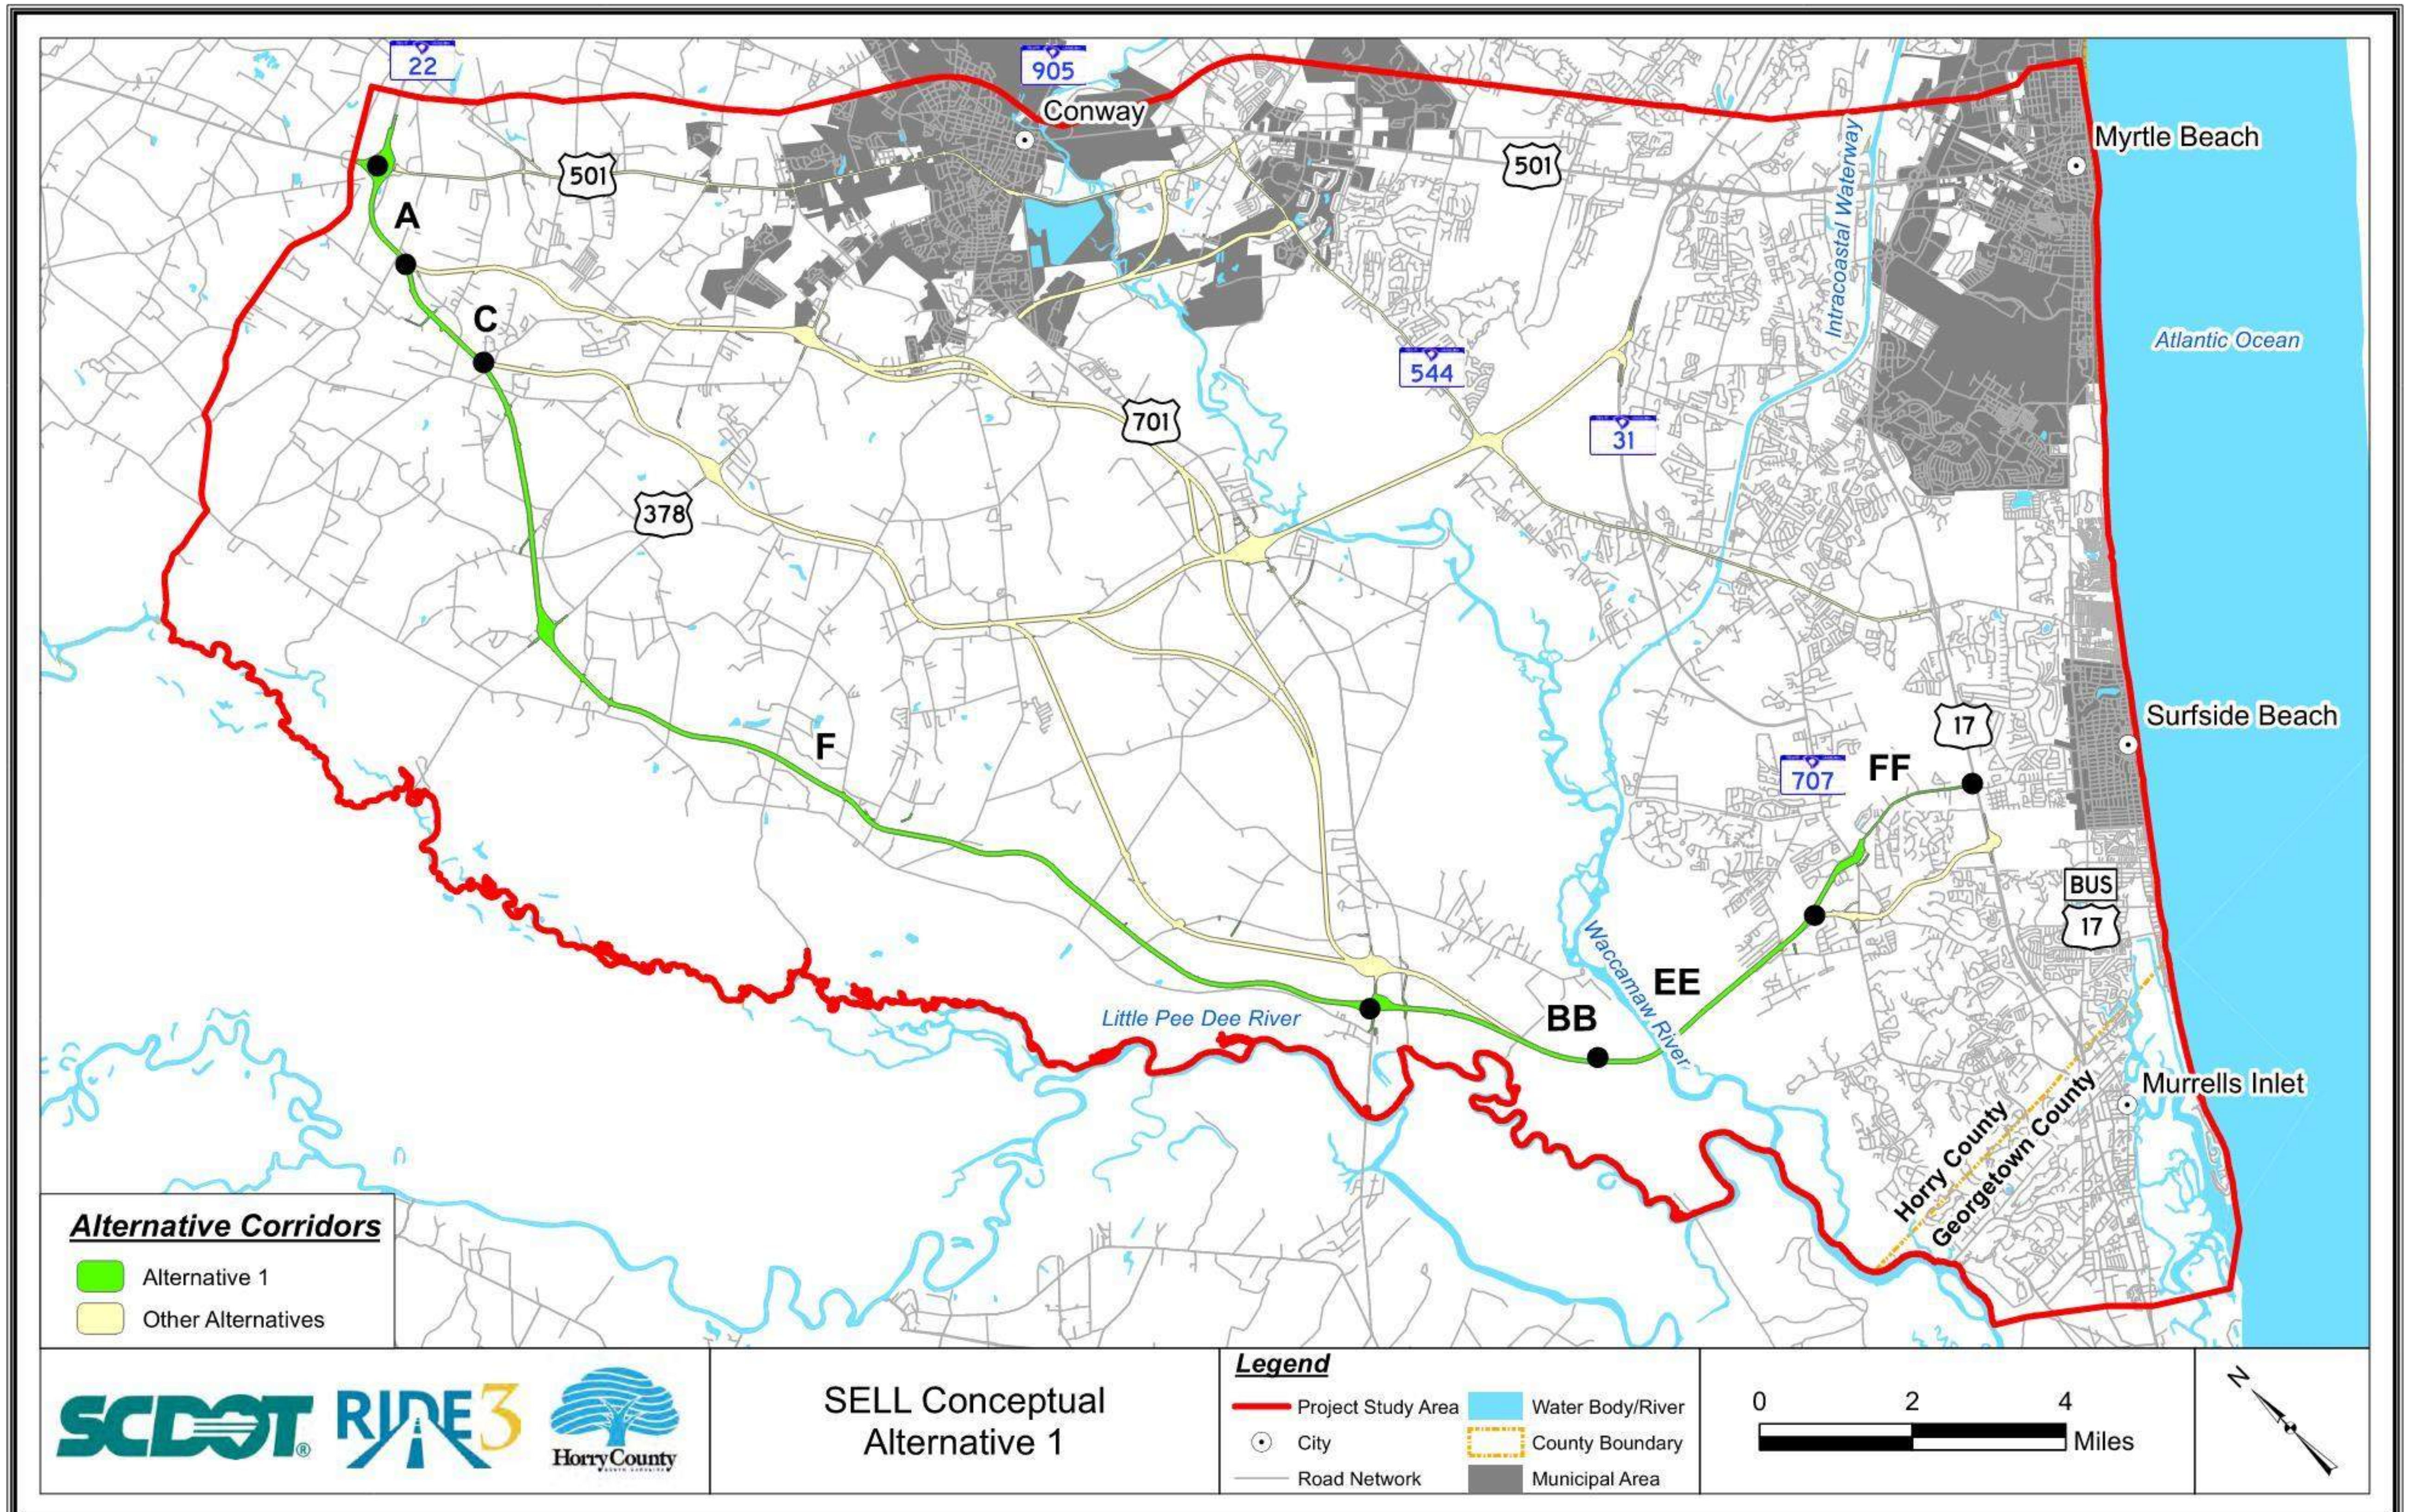

Figure 3.2 - SELL Conceptual Alternative 2

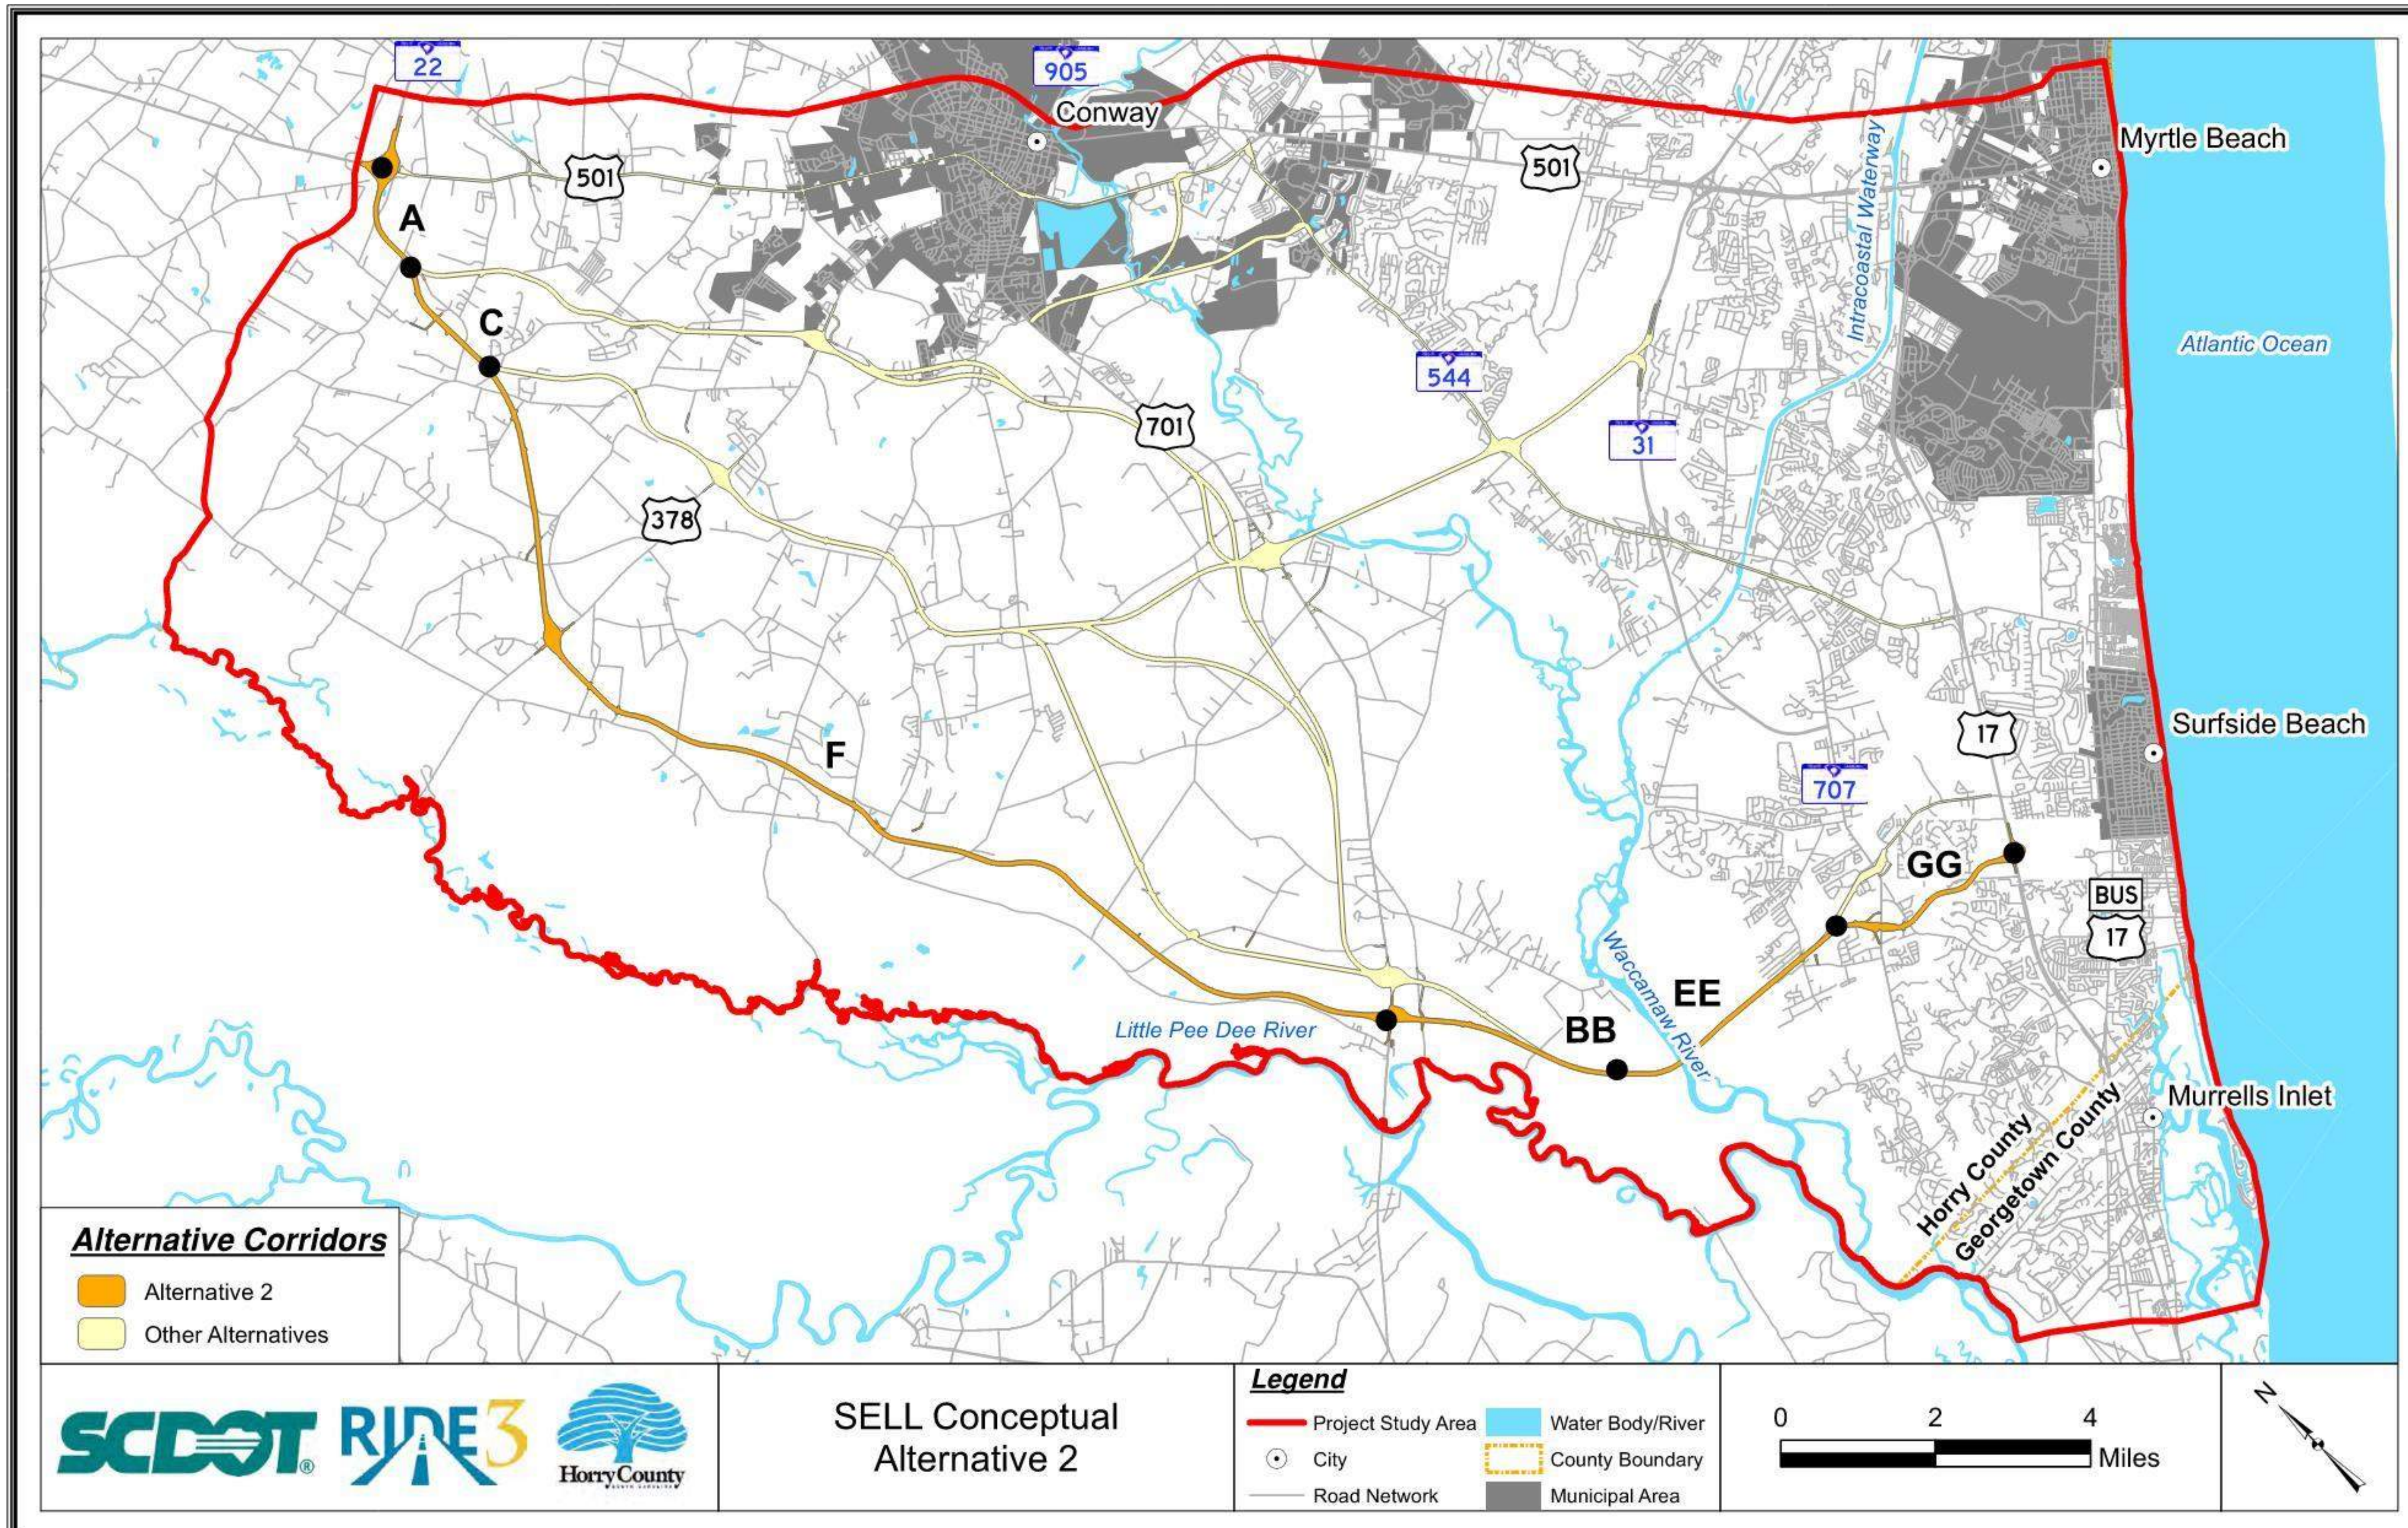

the intersection of US 378 and Highway 134. The proposed interchange at US 378 is a diamond interchange with a single loop ramp in the northeast quadrant connecting northbound SELL to westbound US 378. At this point Alternative 3&5 turns to the southwest and the alignments of Alternatives 3 and 5 separate at Pauley Swamp Road until they coincide again at US 701 about 0.5 miles northeast of where Alternative 1 is proposed to cross US 701. The interchange at US 701 is a partial cloverleaf interchange with a loop on-ramp in the northwest quadrant connecting westbound US 701 to southbound SELL, and a loop on-ramp in the southeast quadrant connecting eastbound US 701 to northbound SELL. Alternative 3&5 continues south for another 1.7 miles before the alignment follows the remainder of Alternative 1. At SC 707, a Single Point Urban Interchange (SPUI) is proposed. Similar to Alternative 1, Alternative 3&5 proceeds east along the alignment of Holmestown Road until it terminates at the existing grade-separated intersection of US 17 and Glenns Bay Road. Alternative 3&5 is 30.6 miles long. Alternative 3 is shown in **Figure 3.3** and Alternative 5 is shown in **Figure 3.4**.

3.4 Alternative 4&6

The alignments for Alternative 4 and 6 are identical to the alignments for Alternatives 3 and 5, until approximately 0.8 miles west of SC 707, where Alternative 4&6 follows the alignment of Alternative 2 to its southern terminus at US 17. For the purposes of the analysis, Alternatives 4 and 6 are essentially identical and 'Alternative 4&6' is used to indicate results for these two similar alternatives. The proposed interchange at US 378 is a diamond interchange with a single loop ramp in the northeast quadrant connecting northbound SELL to westbound US 378. The interchange at US 701 is a partial cloverleaf interchange with a loop on-ramp in the northwest quadrant connecting westbound US 701 to southbound SELL, and a loop on-ramp in the southeast quadrant connecting eastbound US 701 to northbound SELL. The interchange of Alternative 4&6 with SC 707 is a proposed Single Point Urban Interchange (SPUI) that is located approximately 4,400 feet south of Holmestown Road. Alternative 4&6 terminates 0.7 miles southwest of the US 17 and Holmestown Road intersection at a directional interchange that incorporates a loop on-ramp from northbound US 17 to northbound SELL. Alternative 4&6 is 30.1 miles long. Alternative 4 is shown in **Figure 3.5** and Alternative 6 is shown in **Figure 3.6**.

3.5 Alternative 7

Alternative 7 follows the alignment of Alternative 3&5 from the US 501/SC 22 interchange until about where it crosses Pauley Swamp Road. At this point, Alternative 7 proceeds southeast, crossing US 701 and SC 544 before it terminates with directional ramps at SC 31. The proposed interchange at US 378 is a diamond interchange with a single loop ramp in the northeast quadrant connecting northbound SELL to westbound US 378. The interchange at US 701 is a partial cloverleaf interchange with directional loop ramps located on the west side of US 701. In the northwest quadrant is a loop off-ramp connecting northbound SELL to southbound US 701. In the southwest quadrant is a loop on-ramp connecting southbound US 701 to southbound SELL. At SC 544, the proposed interchange is a partial cloverleaf/trumpet interchange with directional ramps. A flyover ramp connects northbound SC 544 to northbound SELL. Two loop off-ramps are also present at the SC 544 interchange. In the northwest quadrant, a loop off-ramp directs traffic from northbound SELL to southbound SC 544. In the southeast quadrant, a loop off-ramp carries traffic from southbound SELL to northbound SC 544. Alternative 7 is 22.8 miles long. Alternative 7 is shown in **Figure 3.7**.

Figure 3.3 - SELL Conceptual Alternative 3

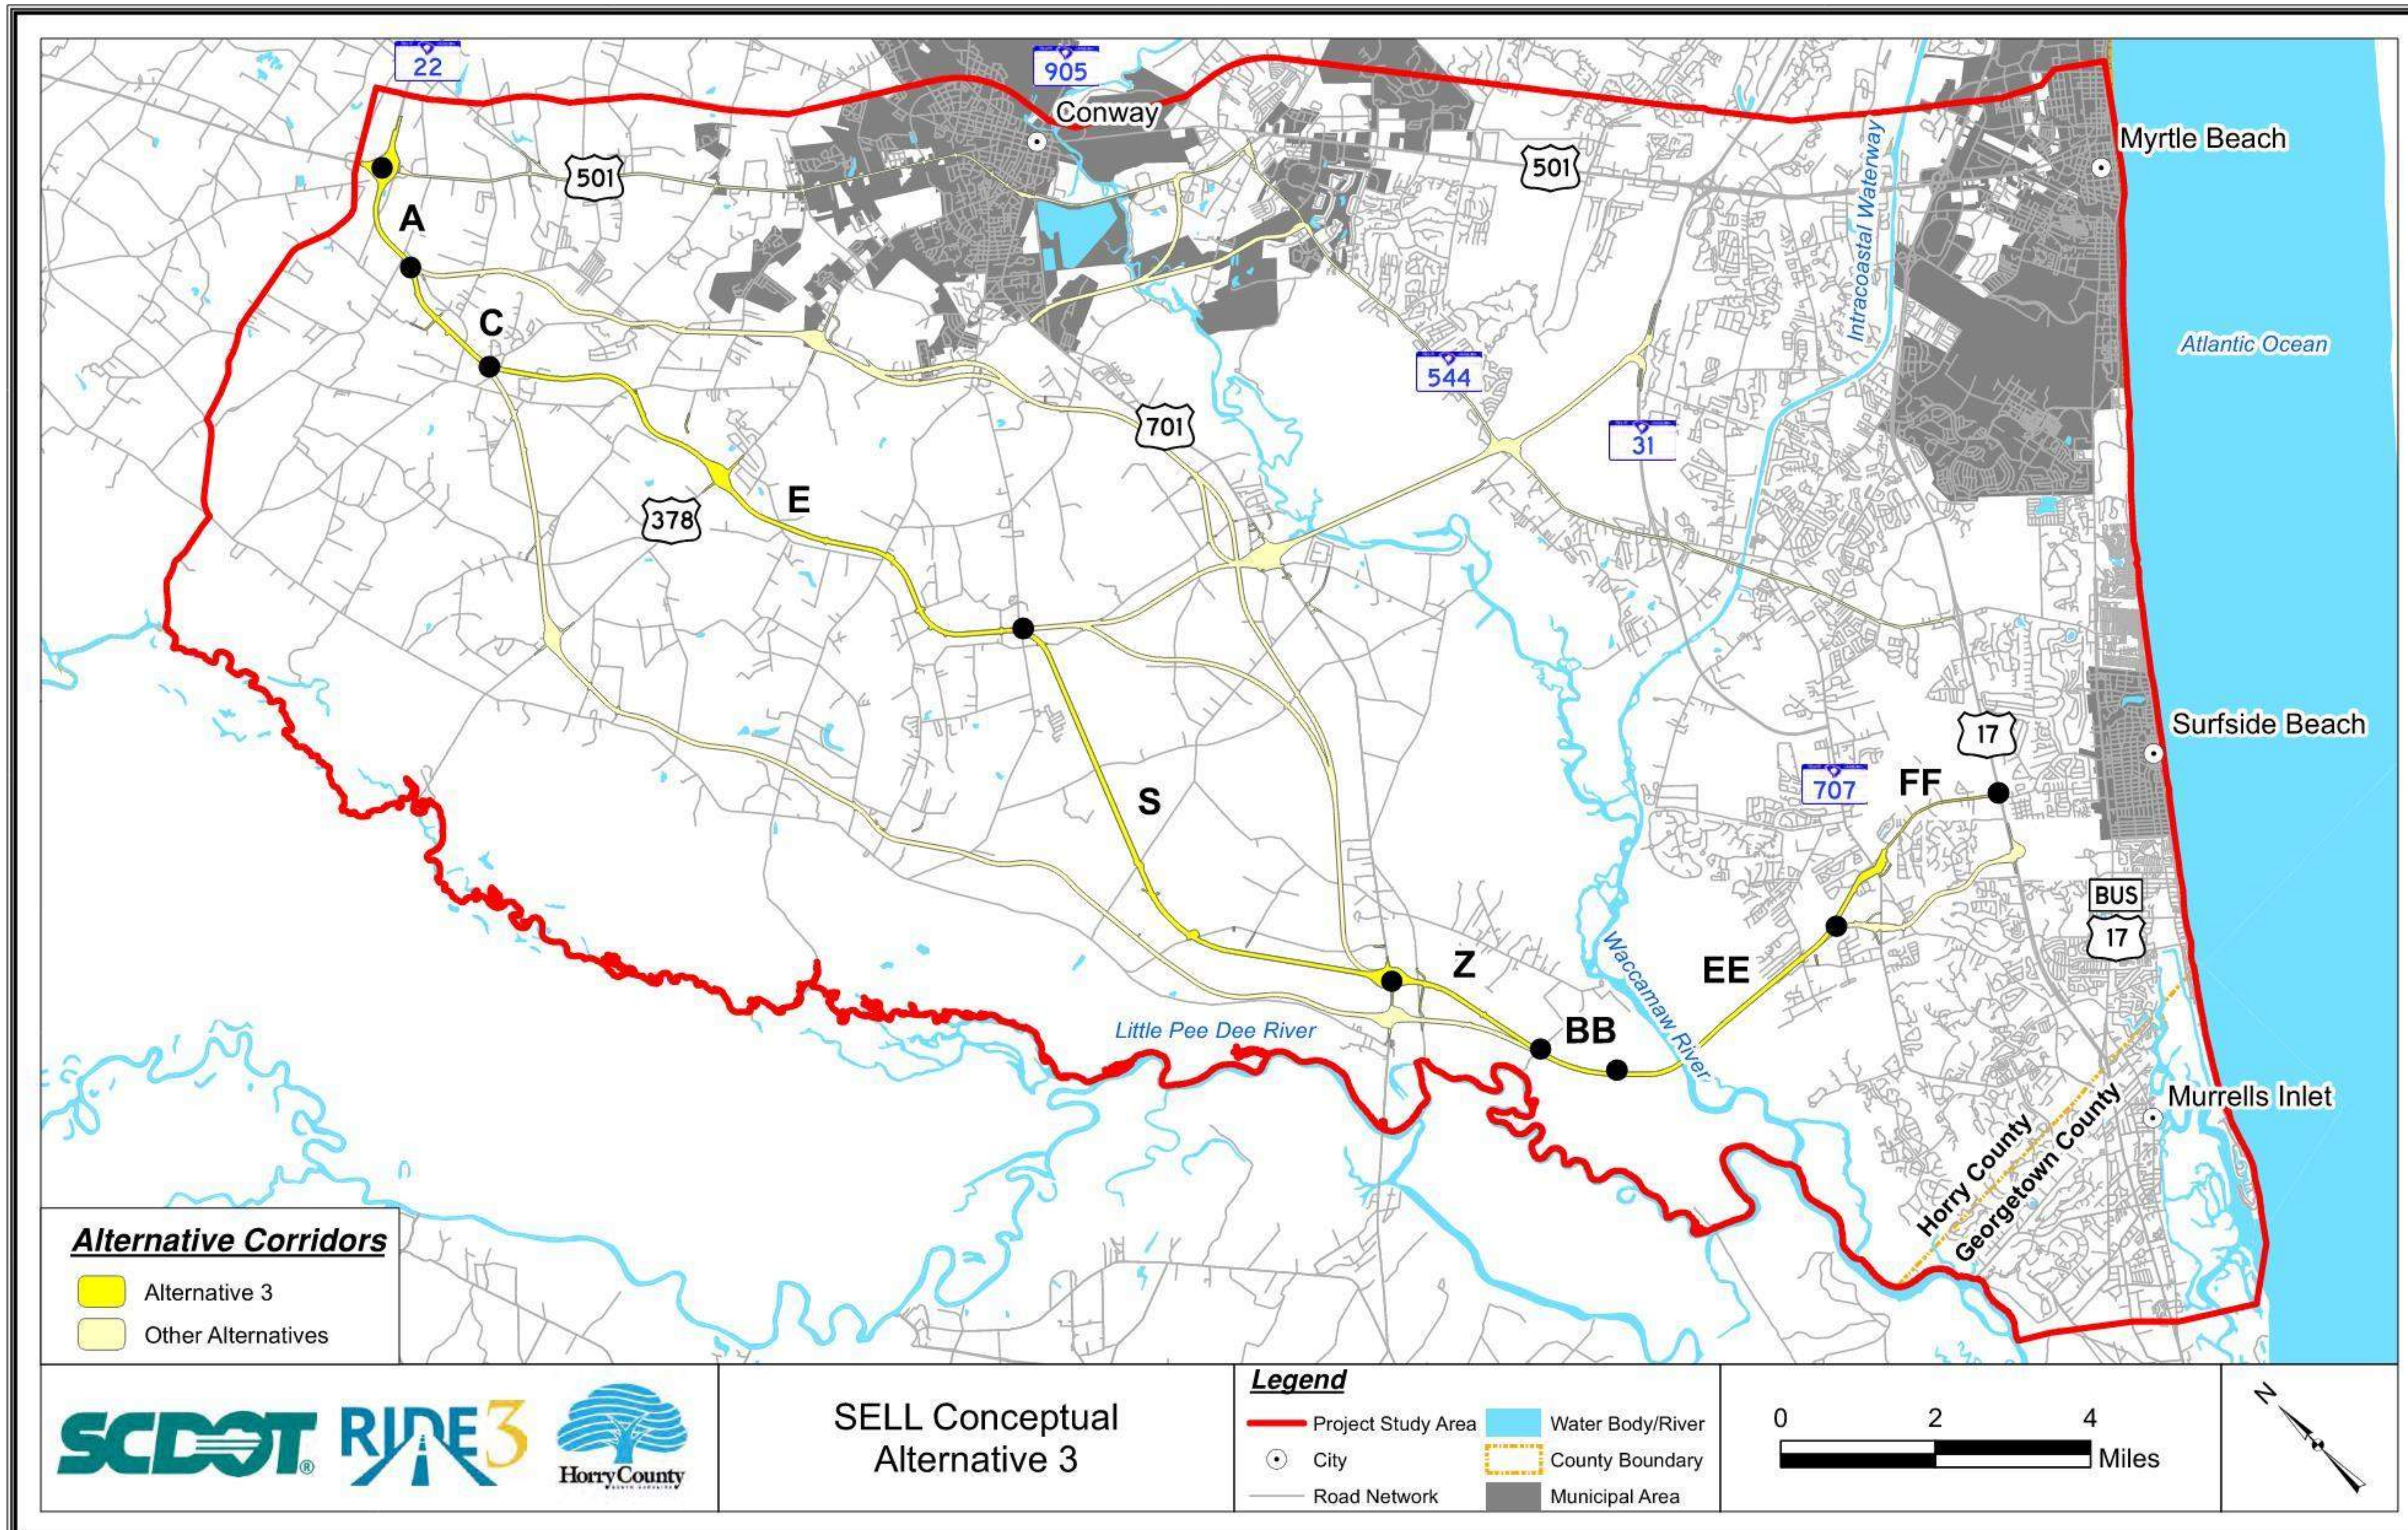

Figure 3.4 - SELL Conceptual Alternative 5

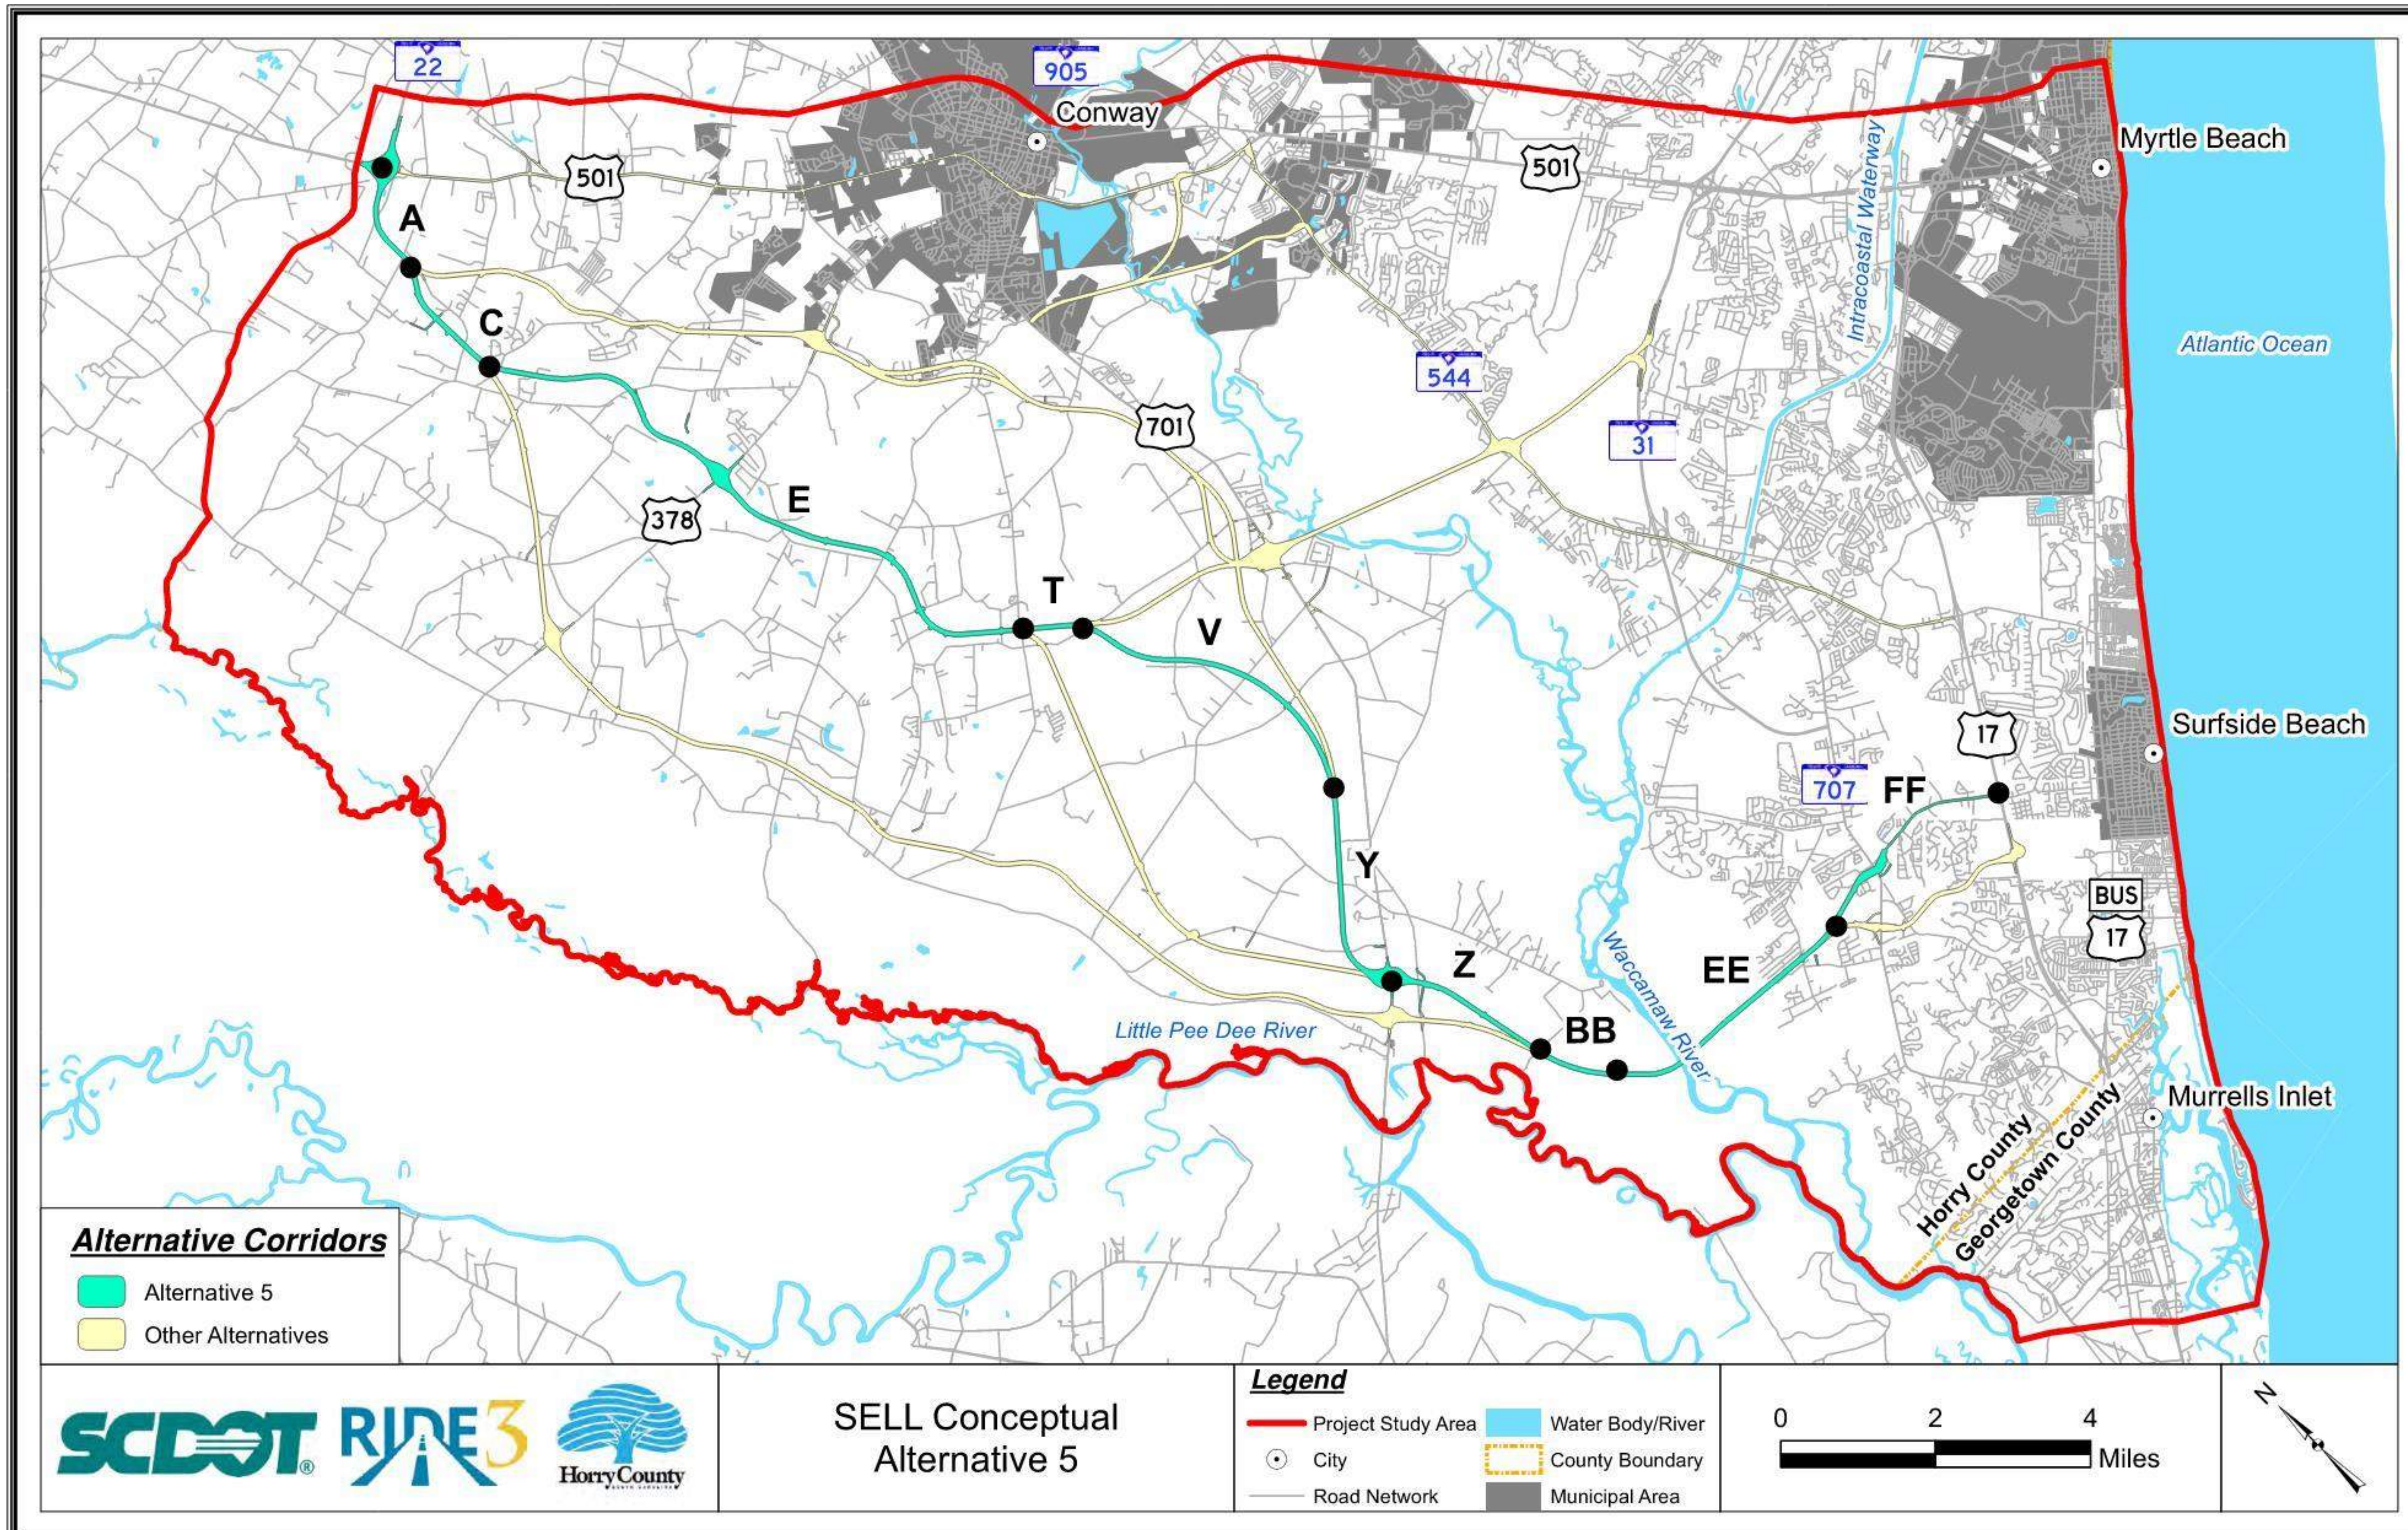

Figure 3.5 - SELL Conceptual Alternative 4

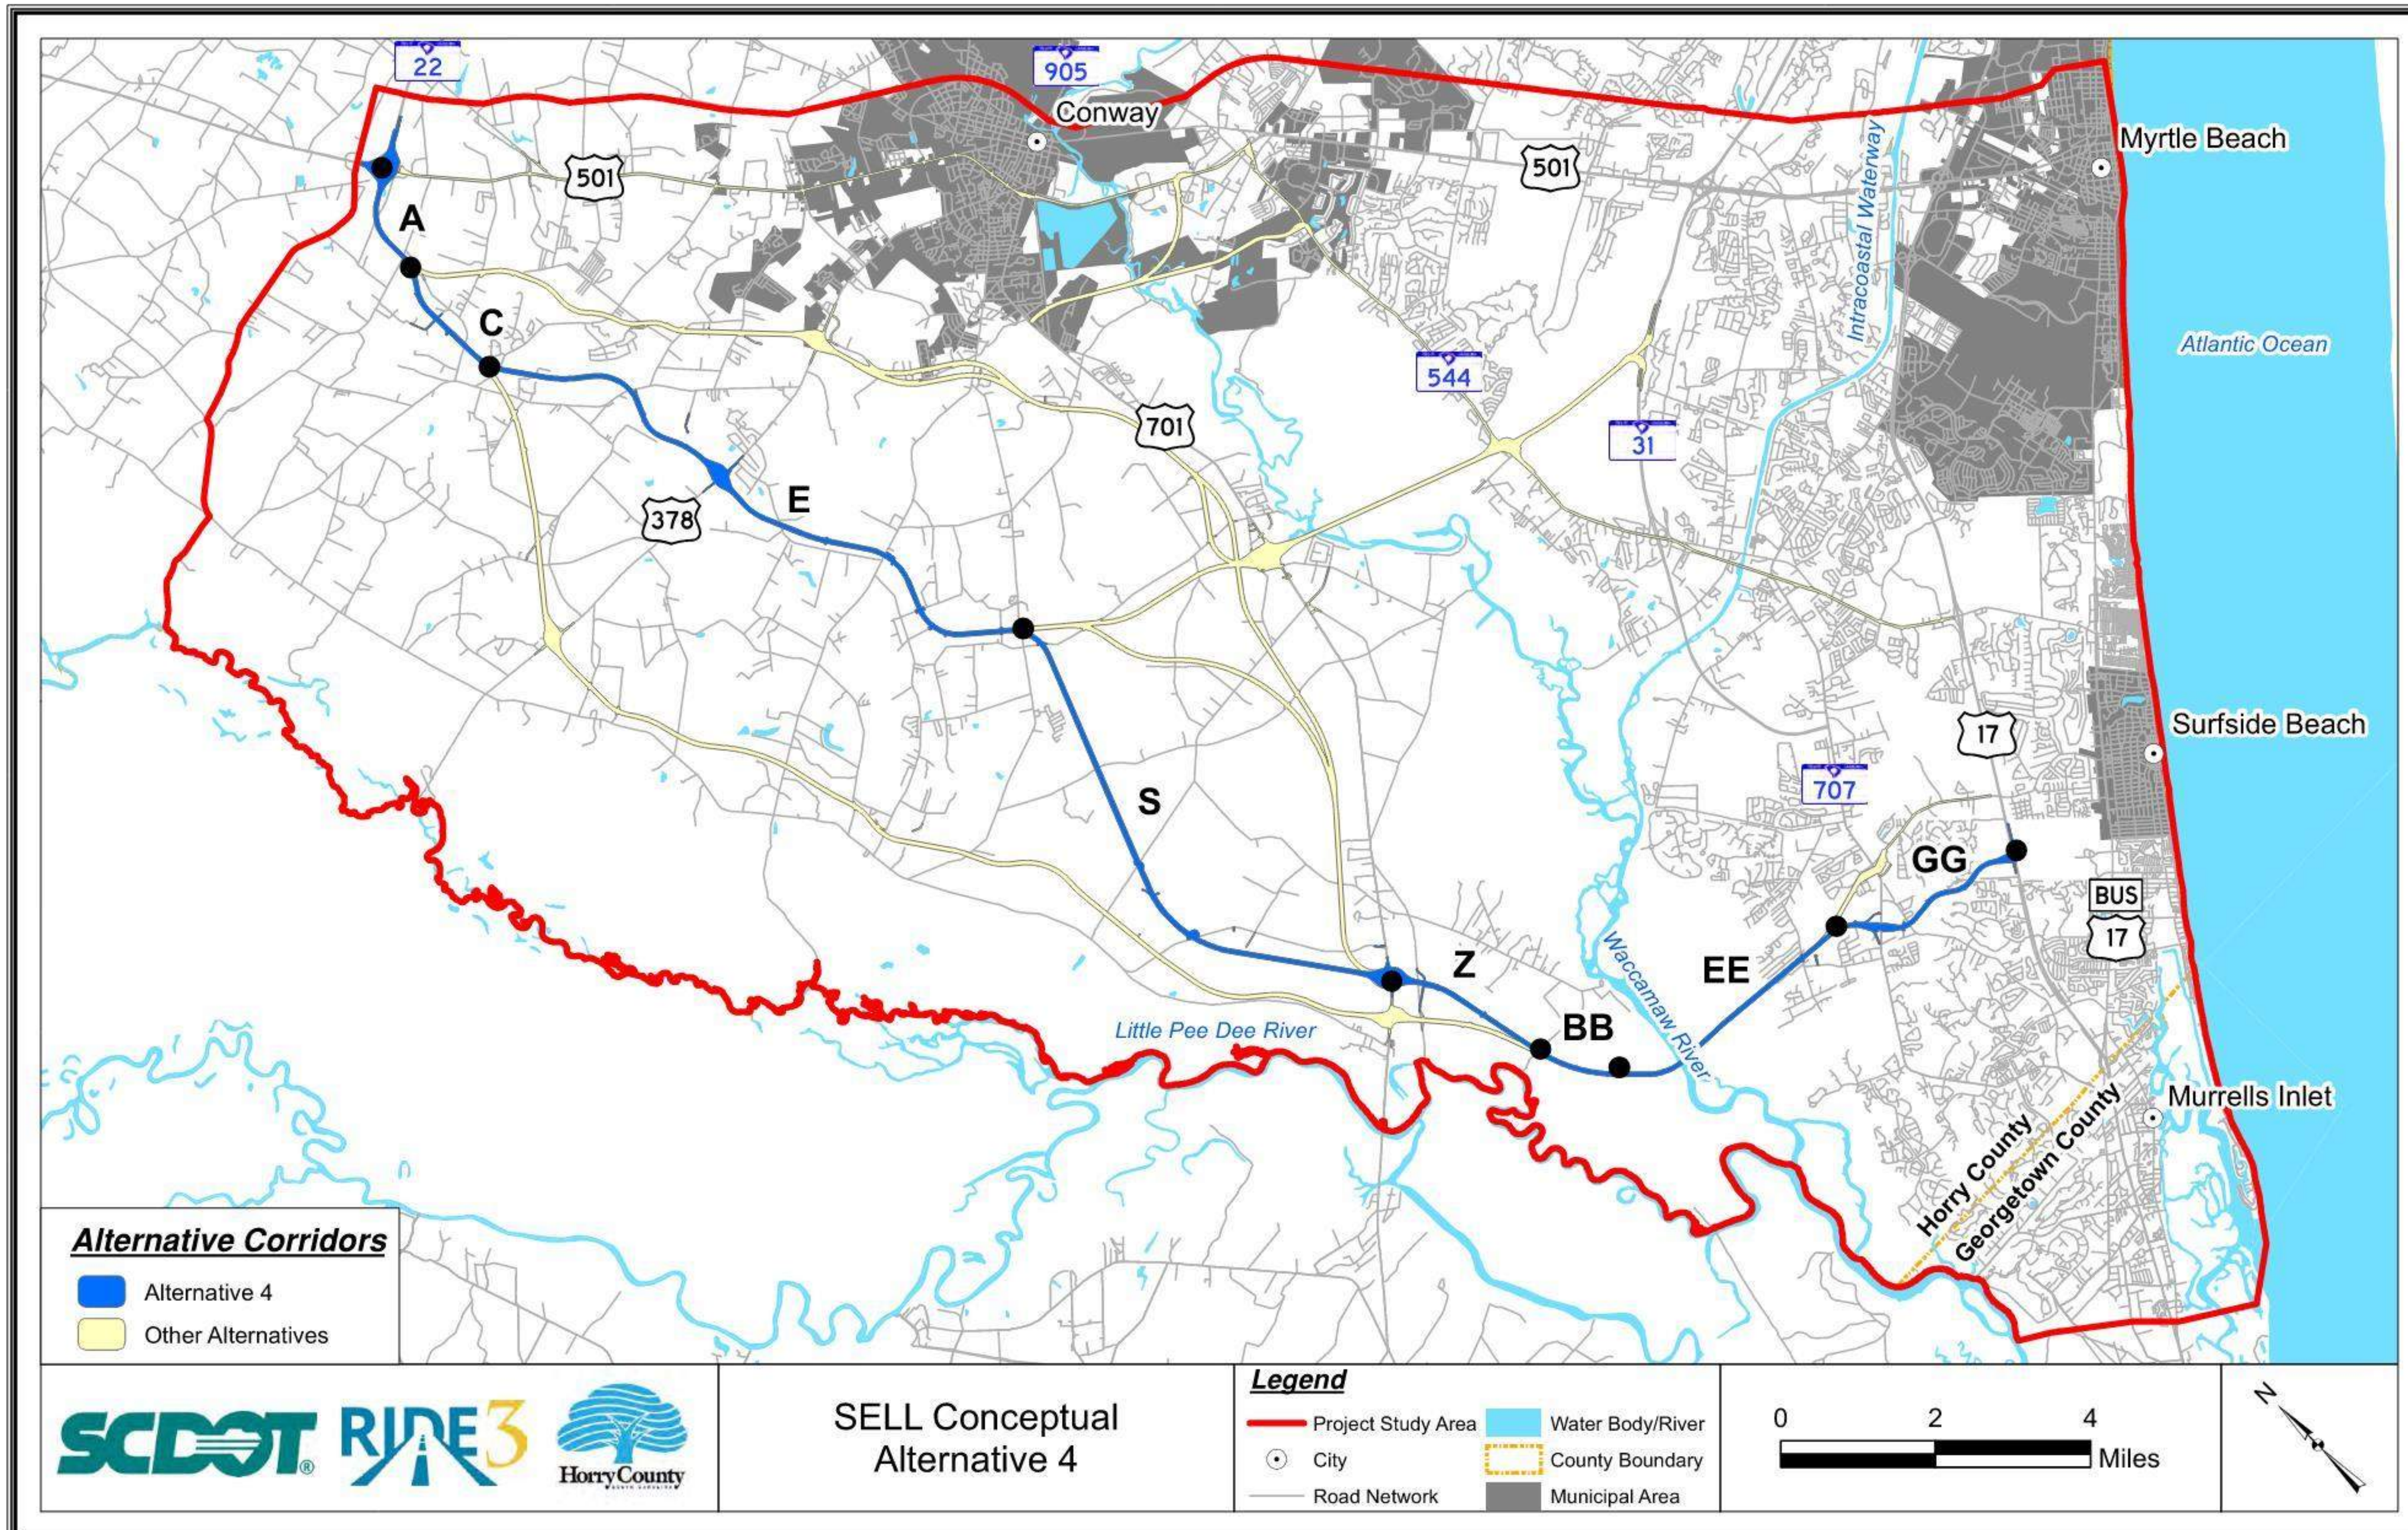

Figure 3.6 - SELL Conceptual Alternative 6

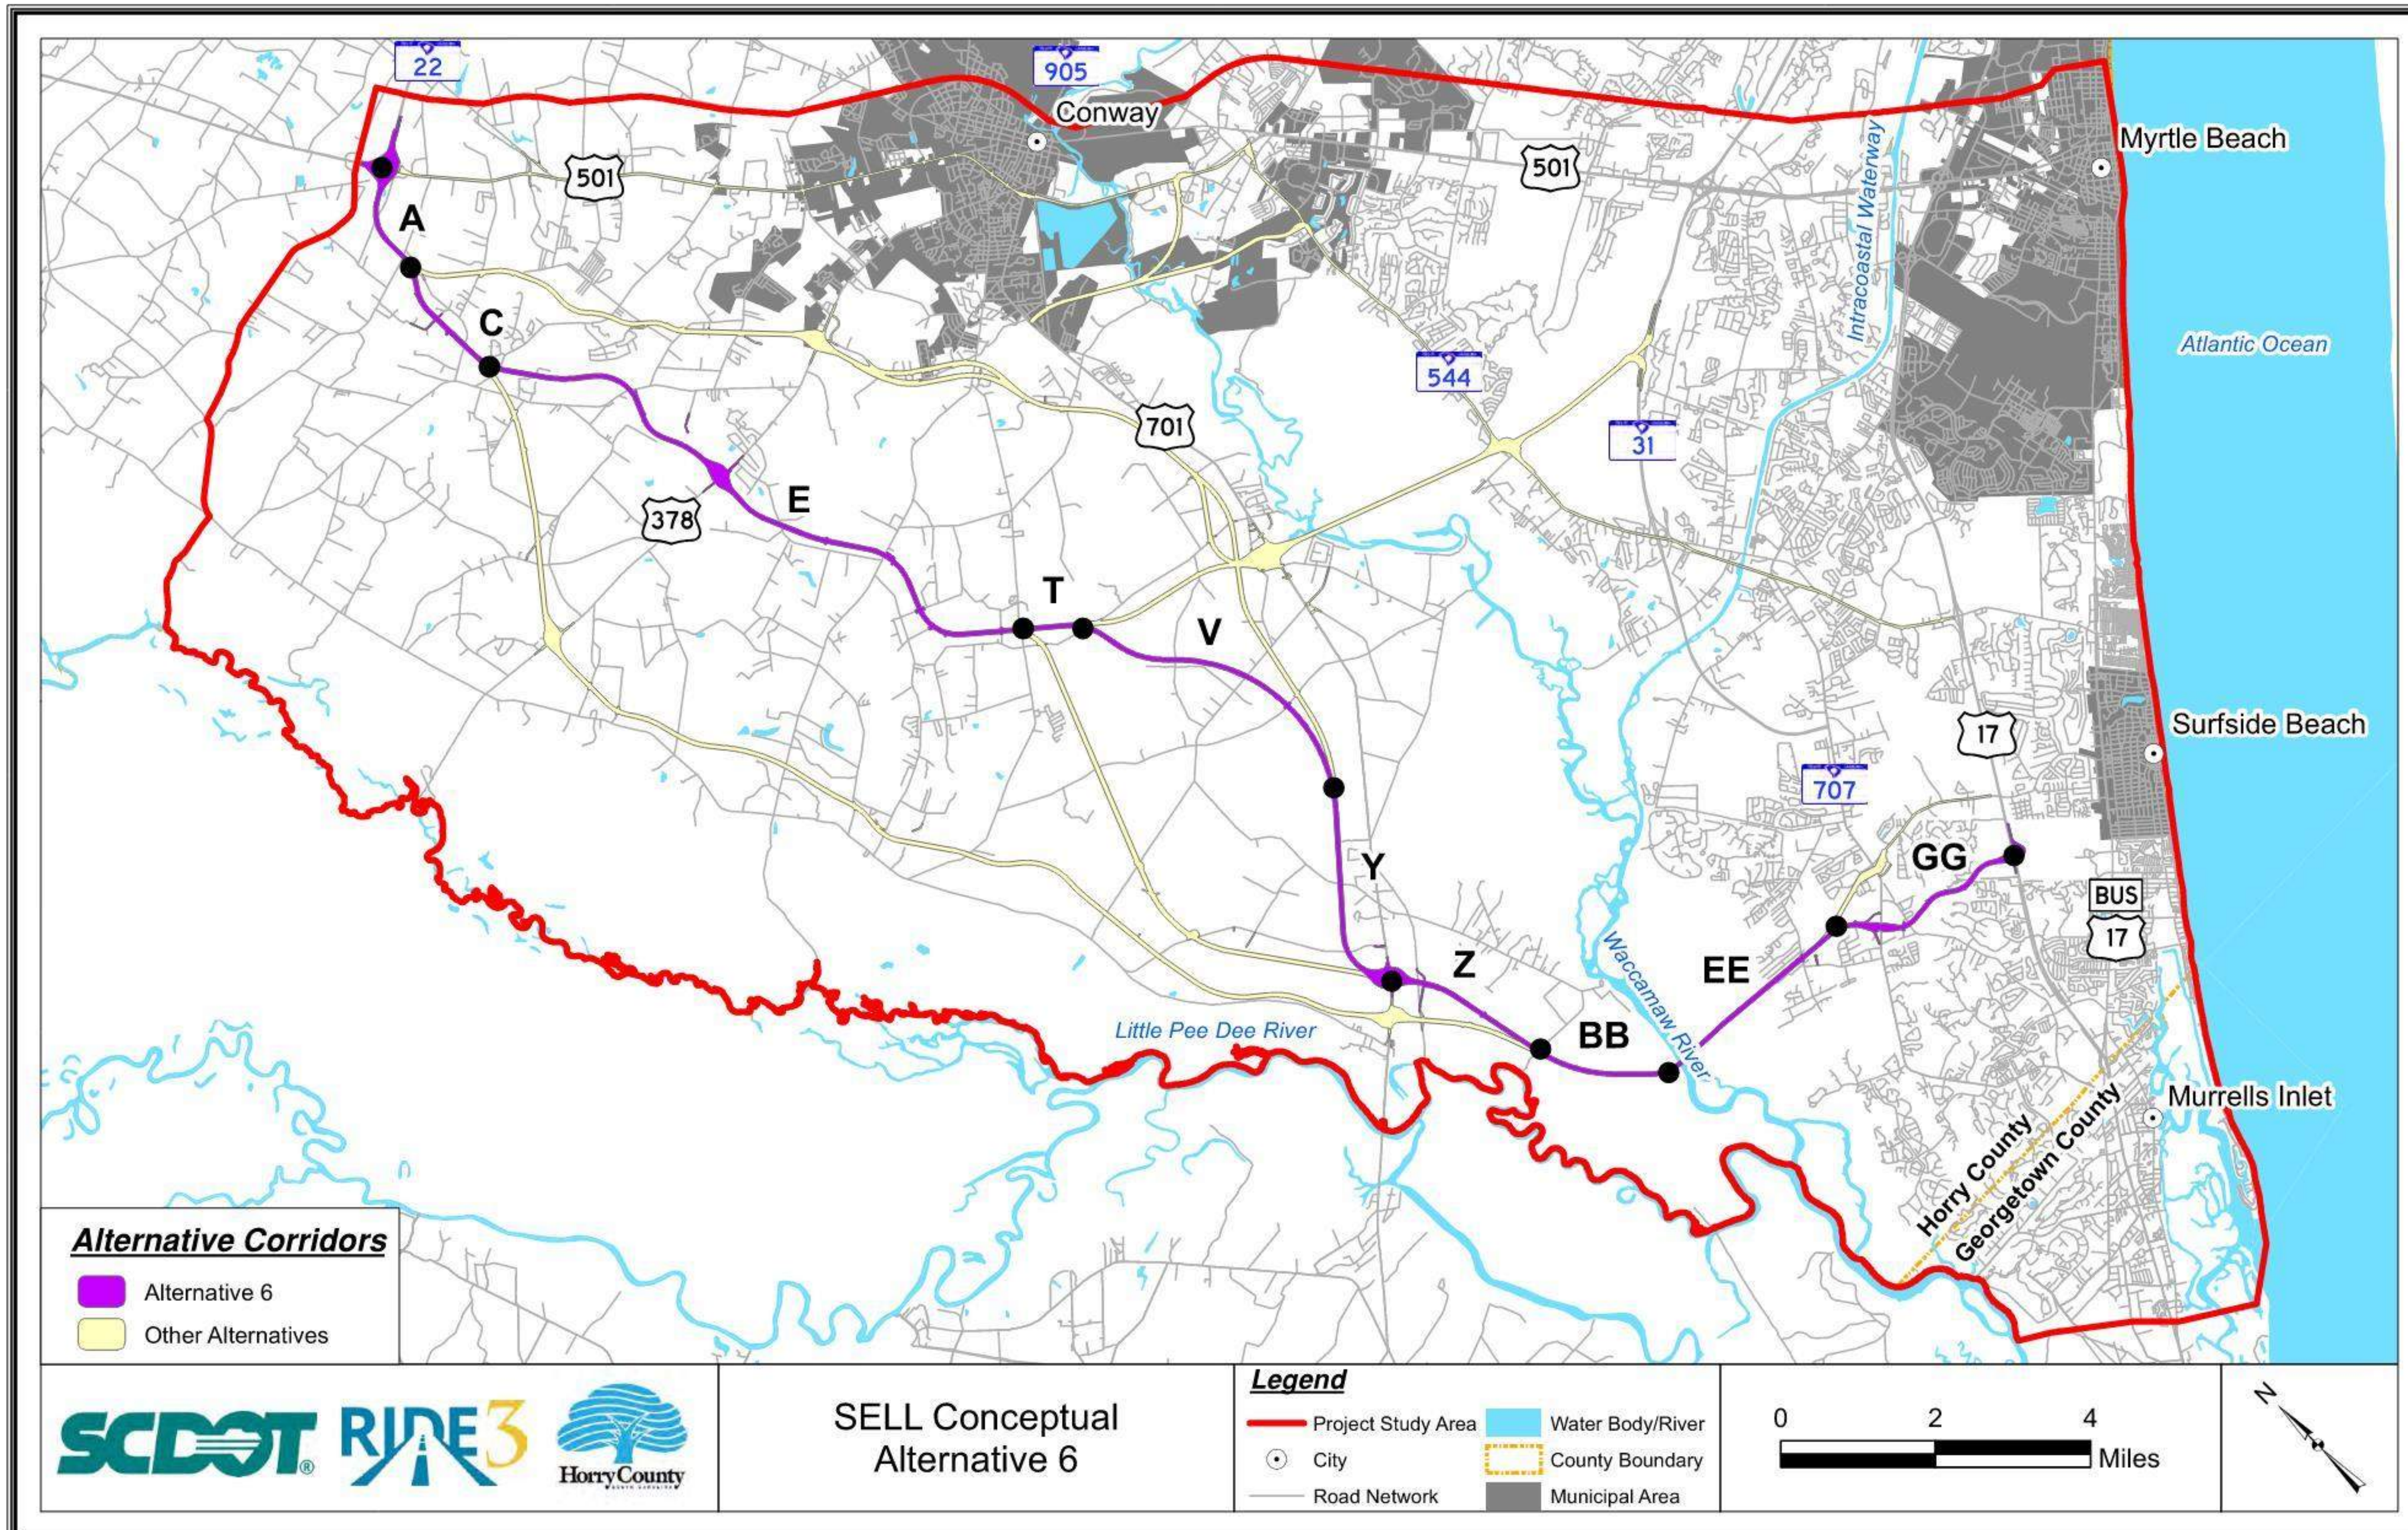

Figure 3.7 - SELL Conceptual Alternative 7

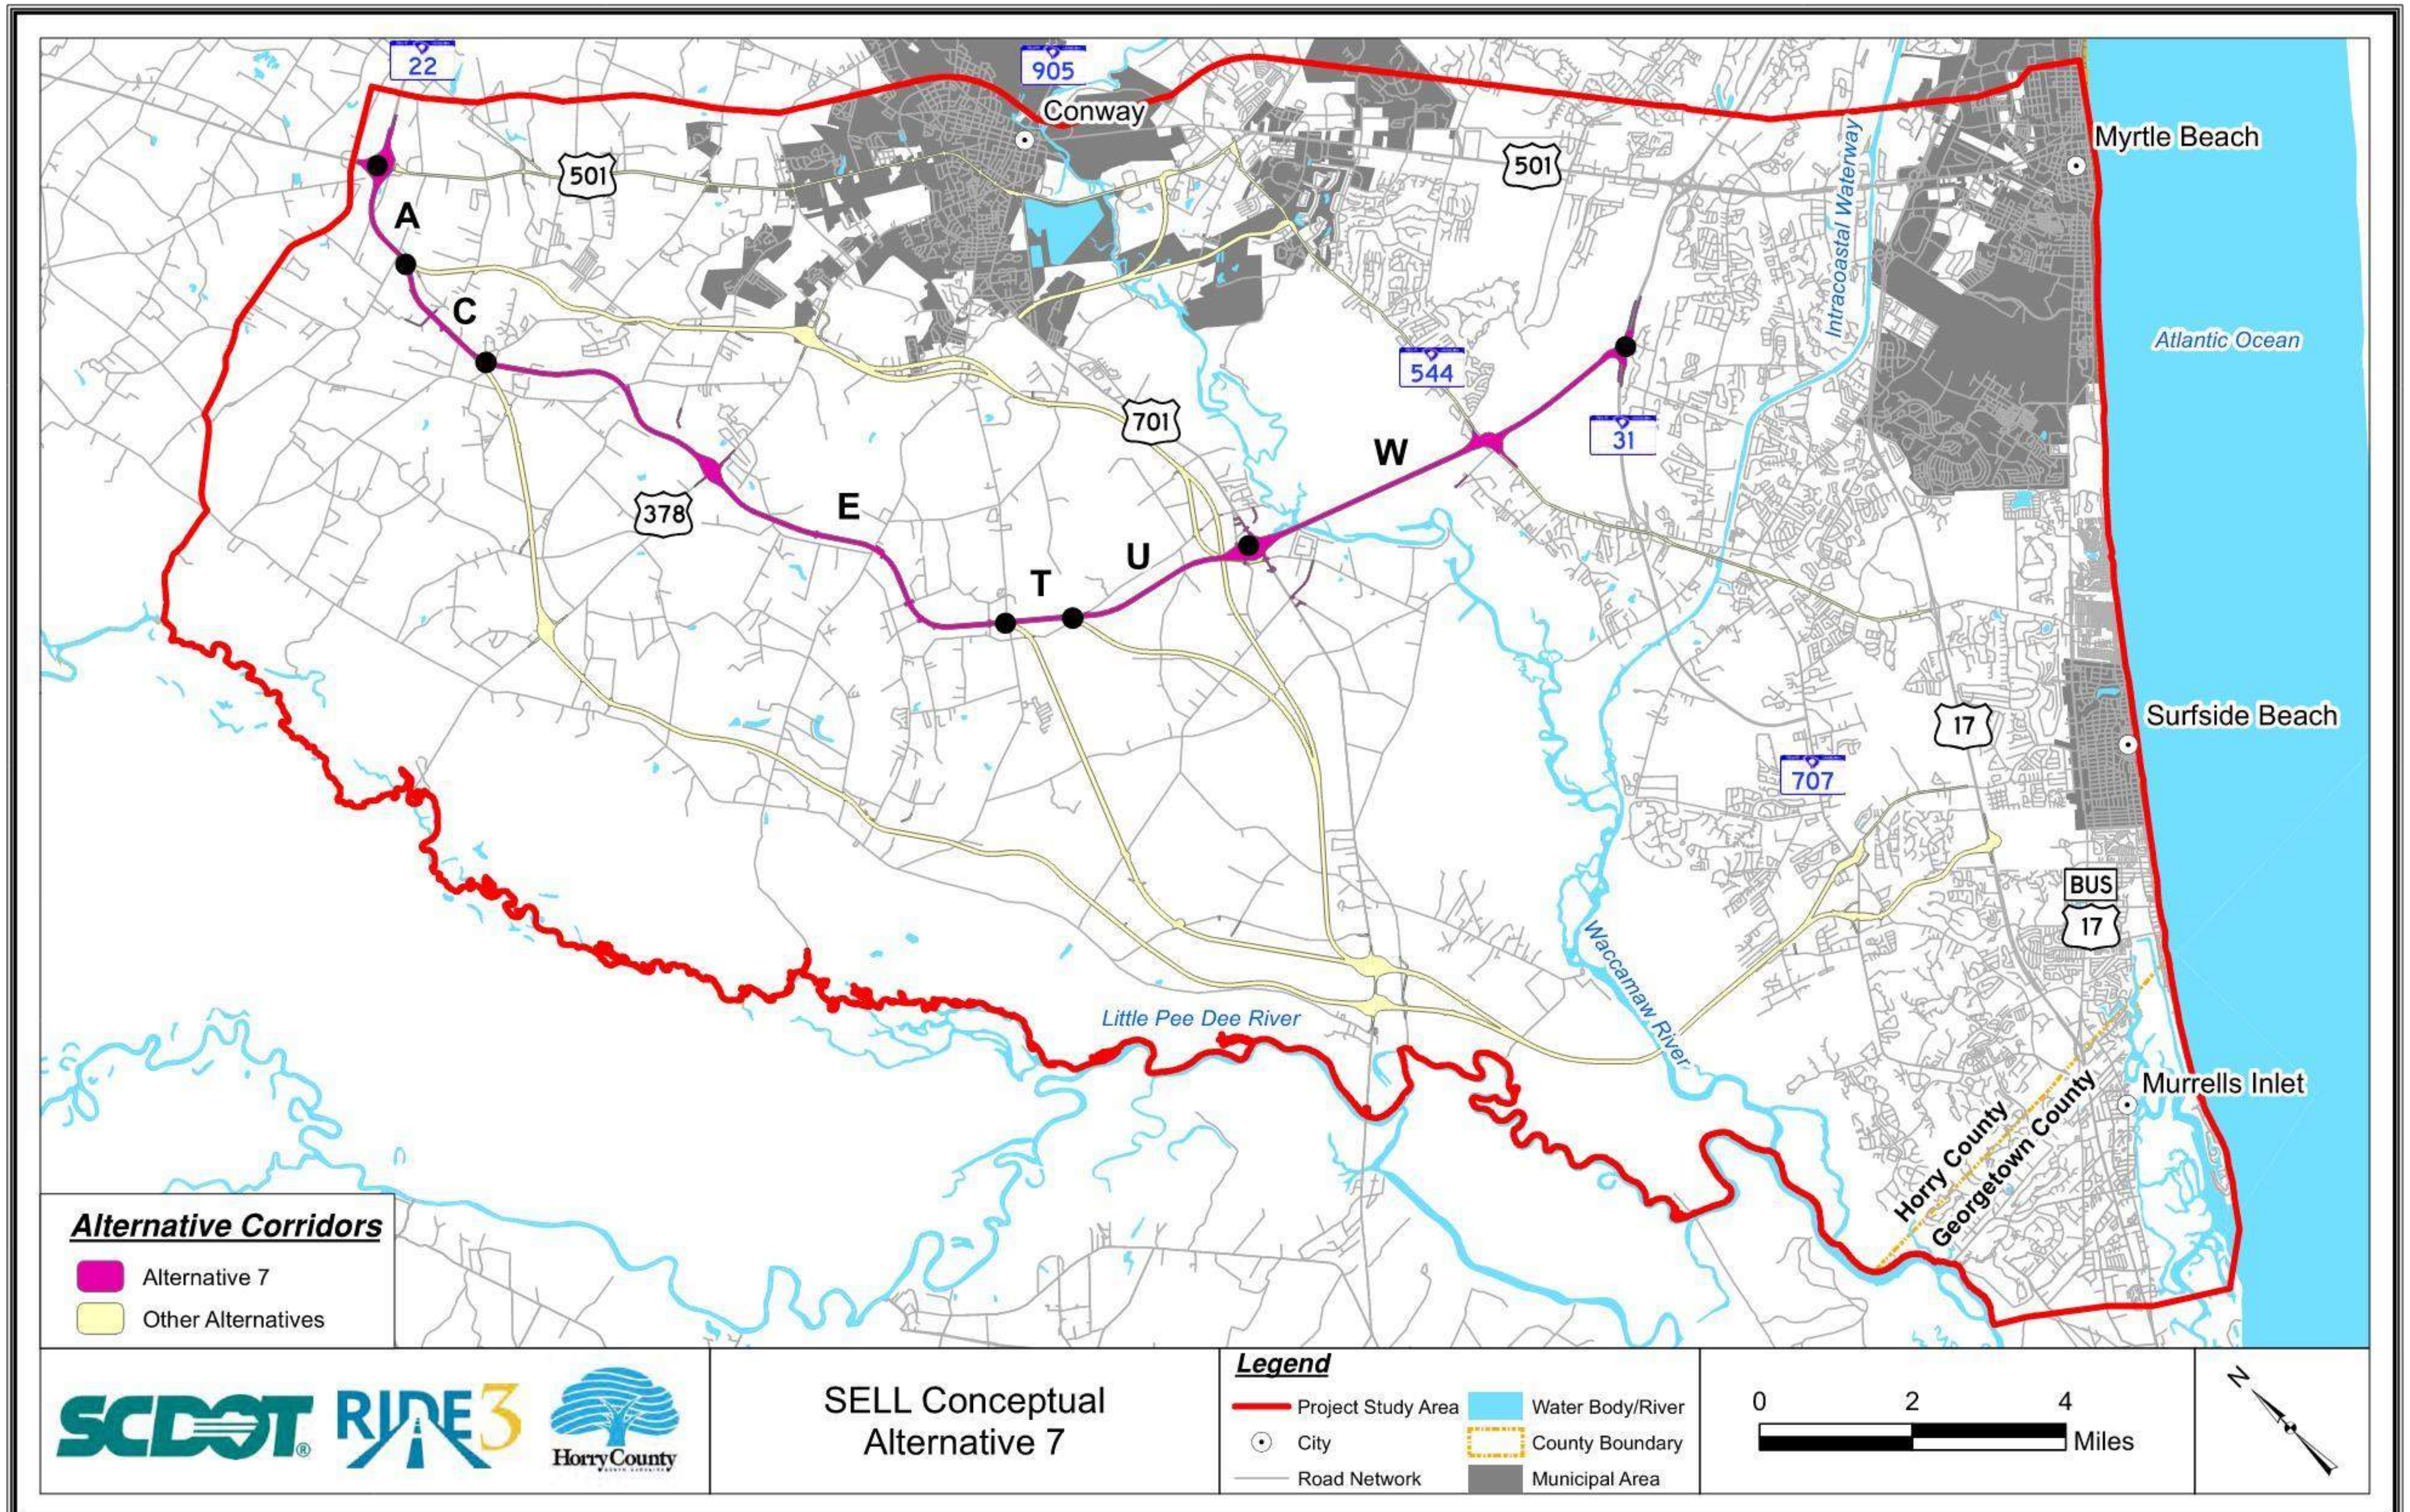

3.6 Alternative 8&9

The alignments for Alternative 8 and 9 are generally similar. They differ for a short distance beginning approximately where the alternatives cross Dirty Branch Road south of their US 378 interchange. Alternative 8 follows an alignment parallel to, but to the west of, Alternative 9. Alternative 8 and 9 again coincide on the same alignment approximately 2.1 miles south of the split, approximately at the location of the existing J and S Countryside Road. For the purposes of the analysis, Alternatives 8 and 9 are essentially identical and 'Alternative 8&9' is used to indicate results for these two similar alternatives.

The first 1.5 miles of Alternative 8&9 is the same as all prior alternatives beginning at the US 501 interchange. Just south of where it crosses Knotty Brand Road, Alternative 8&9 runs southeast then south, generally parallel to Alternative 7, until it generally overlaps the Alternative 7 alignment just west of US 701. Alternative 8&9 then coincides with the alignment of Alternative 7 to their shared terminus at SC 31. The proposed interchange at US 378 is a diamond interchange with a single loop ramp in the northeast quadrant connecting northbound SELL to westbound US 378. The interchange at US 701 is a partial cloverleaf interchange with directional loop ramps located on the west side of US 701. In the northwest quadrant is a loop off-ramp connecting northbound SELL to southbound US 701. In the southwest quadrant is a loop on-ramp connecting southbound US 701 to southbound SELL. At SC 544, the proposed interchange is a partial cloverleaf/trumpet interchange with directional ramps. A flyover ramp connects northbound SC 544 to northbound SELL. Two loop off-ramps are also present at the SC 544 interchange. In the northwest quadrant, a loop off-ramp directs traffic from northbound SELL to southbound SC 544. In the southeast quadrant, a loop off-ramp carries traffic from southbound SELL to northbound SC 544. Alternative 8&9 is 22.1 miles long. Alternative 8 is shown in **Figure 3.8** and Alternative 9 is shown in **Figure 3.9**.

3.7 Alternative 10&11

The alignments for Alternative 10 and 11 are generally similar and coincide with the alignments for Alternatives 8&9 between the US 501/SC 22 interchange and the location where the alignments for these four alternatives separate near Kinlaw Lane. Similar to Alternatives 8&9, Alternatives 10 and 11 separate for about 2.1 miles beginning approximately where the alternatives cross Dirty Branch Road south of their US 378 interchange. Alternative 10 follows an alignment parallel to, but to the west of, Alternative 11. Alternative 10 and 11 again coincide on the same alignment approximately 2.1 miles south of the split, approximately at the location of the existing J and S Countryside Road. For the purposes of the analysis, Alternatives 10 and 11 are essentially identical and 'Alternative 10&11' is used to indicate results for these two similar alternatives.

From the point where the alignments for Alternative 8&9 and Alternative 10&11 separate, Alternative 10&11 continues southwest for about 6.5 miles, where it coincides with Alternative 3&5 just north of US 701. Alternative 10&11 then continues along the same alignment as Alternative 3&5 to their common terminus at US 17.

The proposed interchange at US 378 is a diamond interchange with a single loop ramp in the northeast quadrant connecting northbound SELL to westbound US 378. The interchange at US 701 is a partial cloverleaf interchange with a loop on-ramp in the northwest quadrant connecting westbound US 701 to southbound SELL, and a loop on-ramp in the southeast quadrant connecting eastbound US 701 to northbound SELL. At SC 707, a Single Point Urban Interchange (SPUI) is proposed. Similar to Alternative 1 and Alternative 3&5, Alternative 10&11 proceeds east along the alignment of Holmestown Road until it terminates at the existing grade-separated intersection of

Figure 3.8 - SELL Conceptual Alternative 8

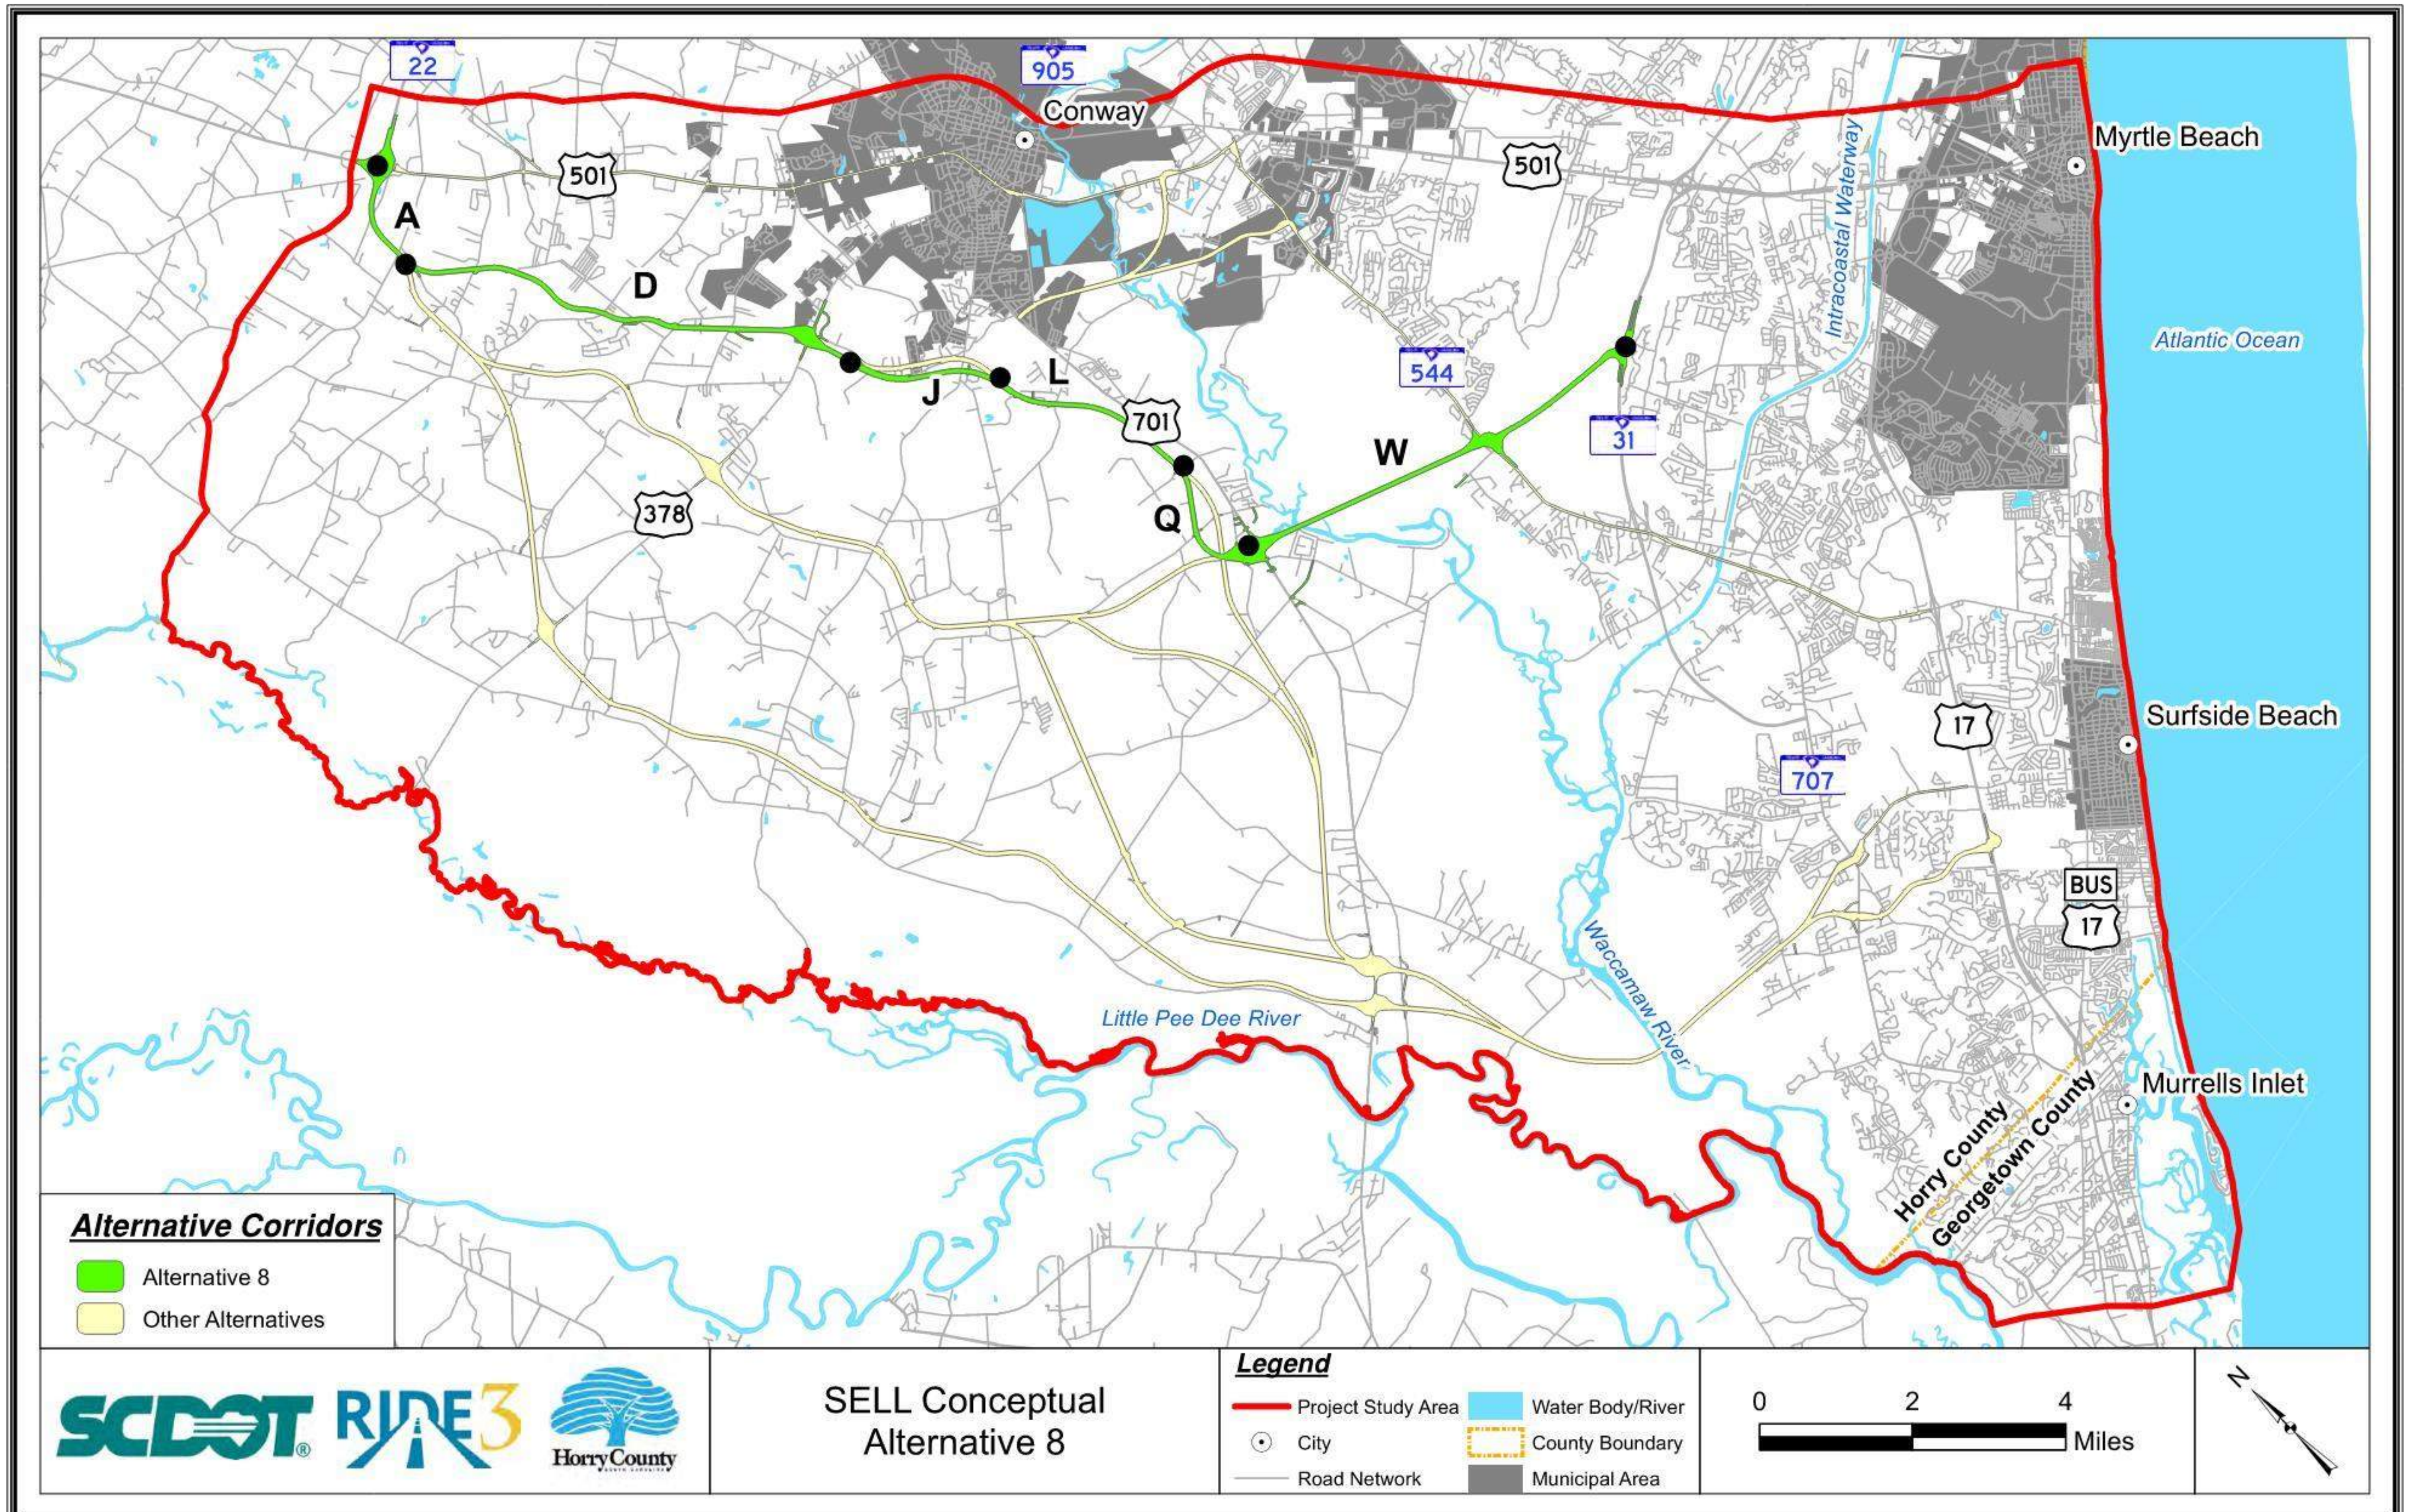

Figure 3.9 - SELL Conceptual Alternative 9

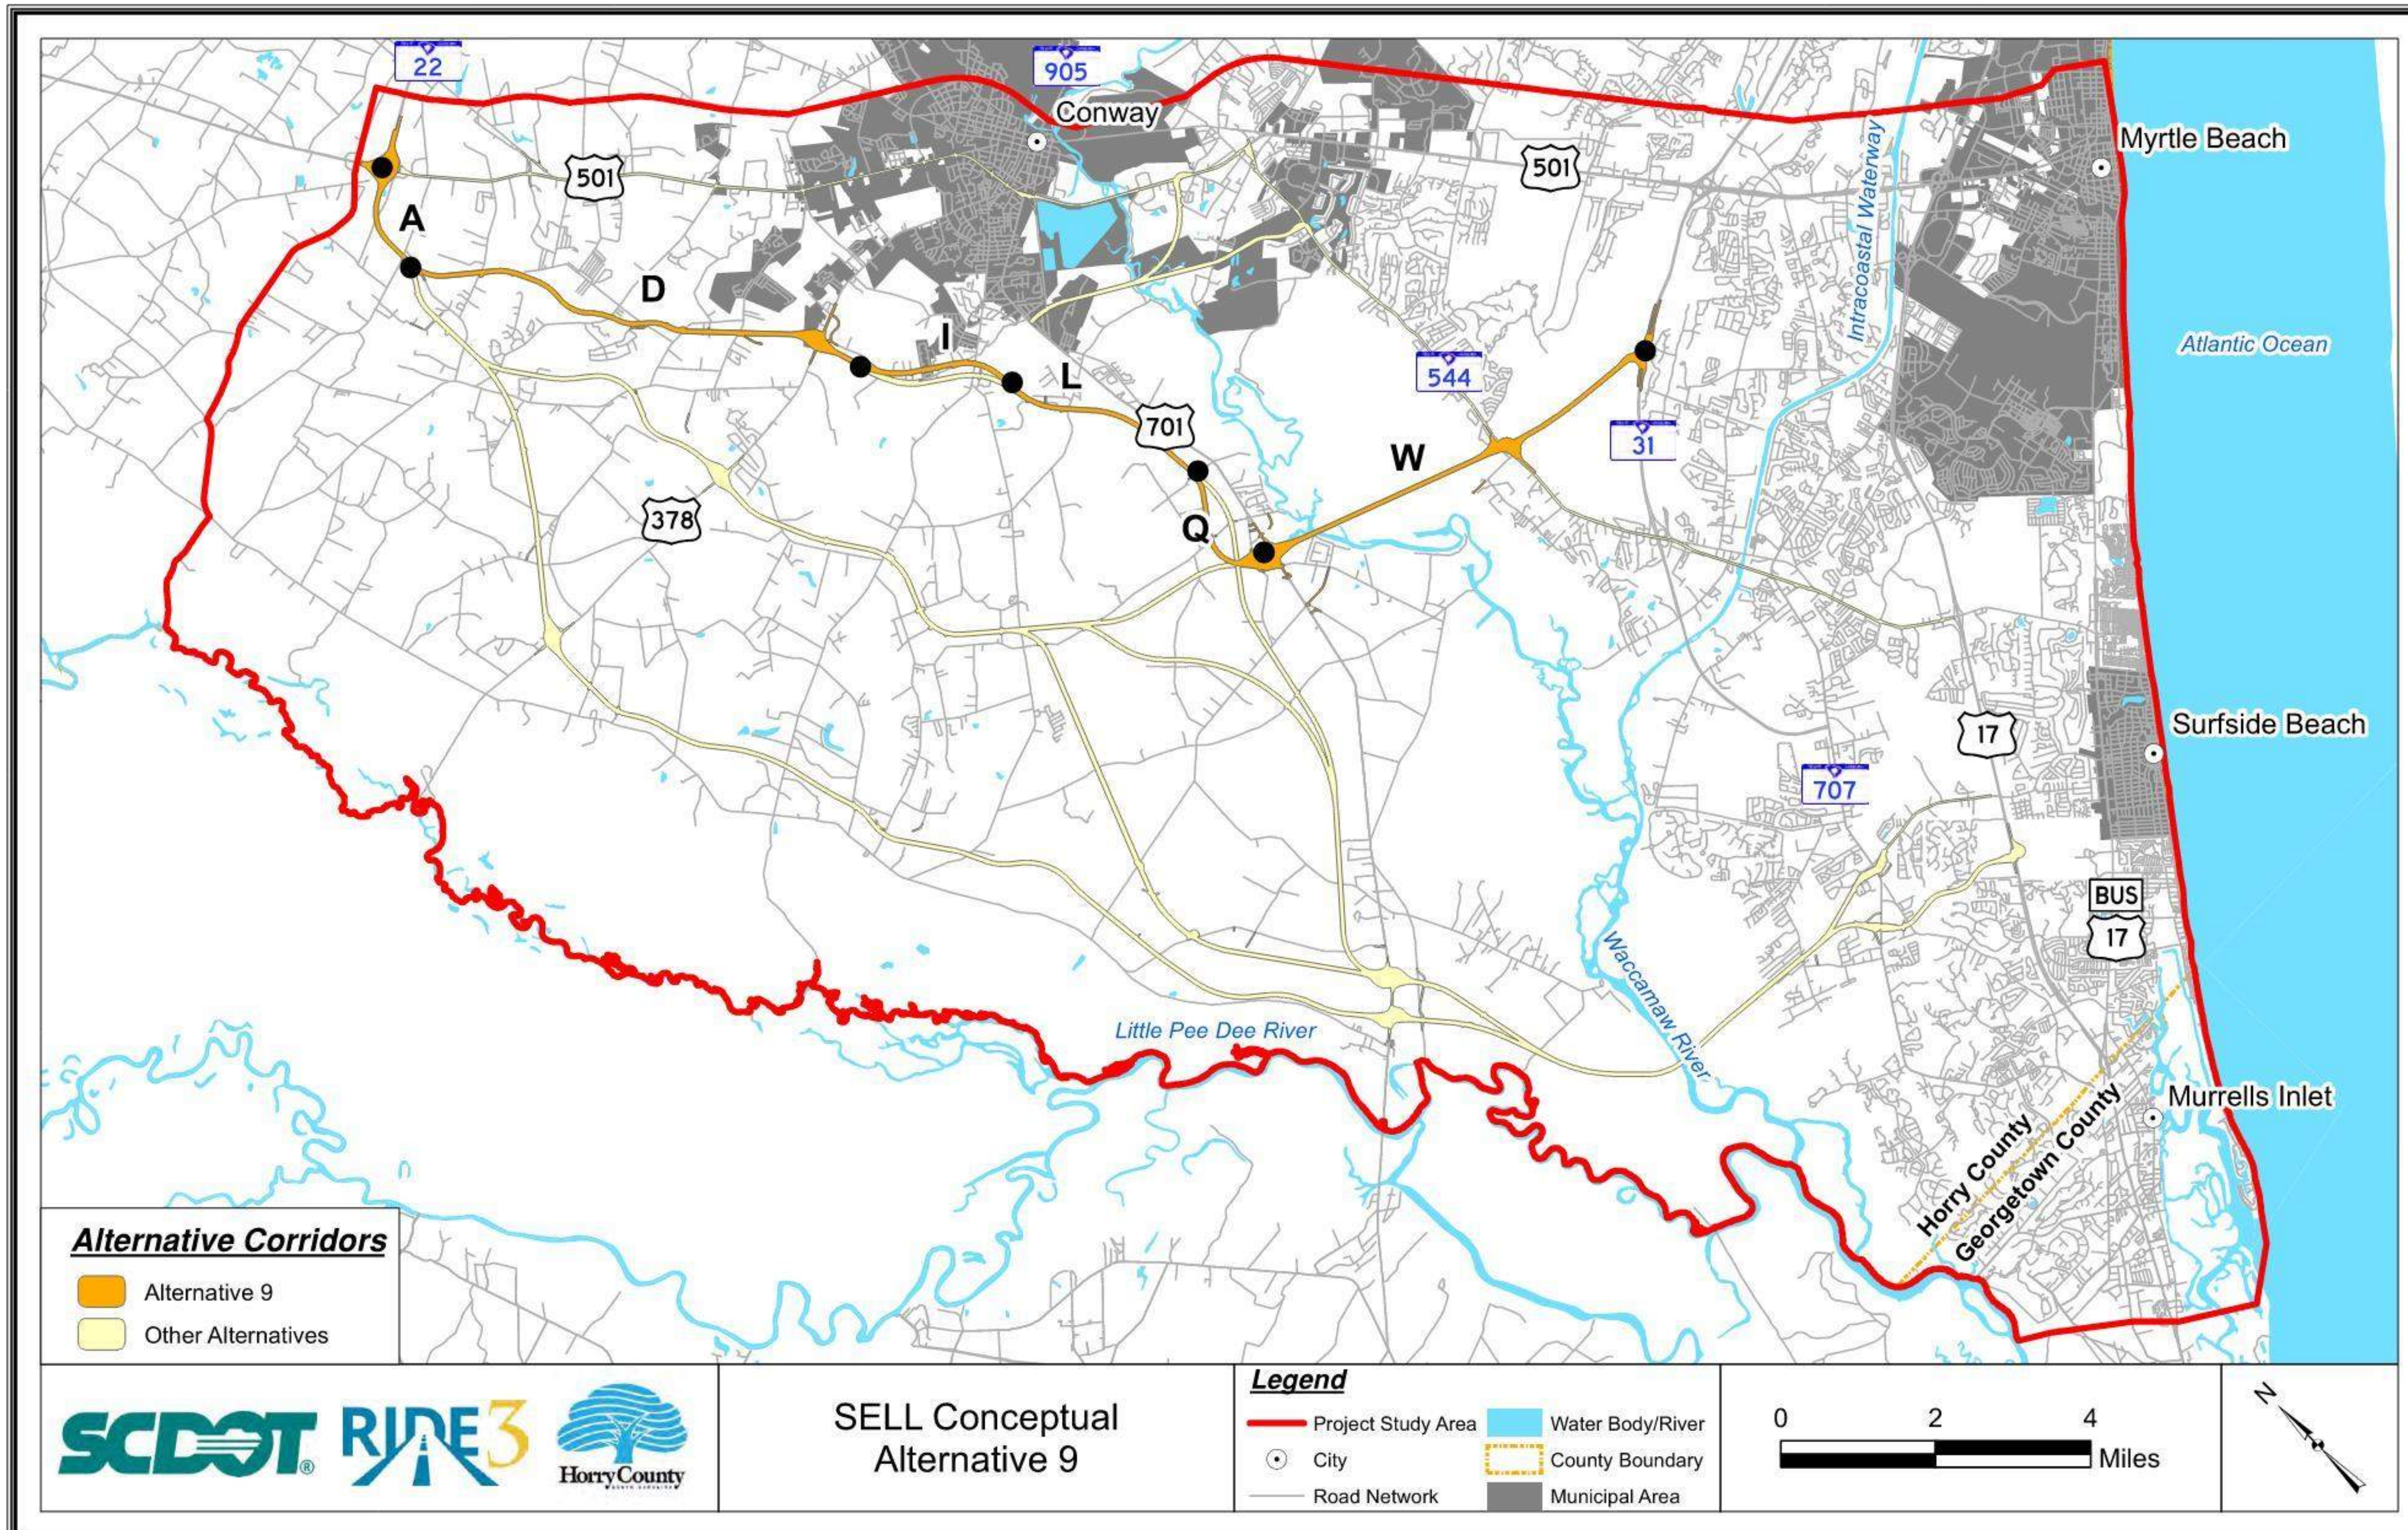

US 17 and Glenns Bay Road. Alternative 10&11 is 31.4 miles long. Alternative 10 is shown in **Figure 3.10** and Alternative 11 is shown in **Figure 3.11**.

3.8 Alternative 12&13

The alignments for Alternative 12 and 13 are generally similar and coincide with the alignments for Alternatives 10&11 from the Conway Bypass/US 501 interchange until approximately 0.8 miles west of SC 707. At that point, the Alternative 12 and Alternative 13 alignment continues along a more southern route than Alternative 10&11, along the alignment used by Alternative 2 and Alternative 4&6 to its terminus with US 17. For the purposes of the analysis, Alternatives 12 and 13 are essentially identical and 'Alternative 12&13' is used to indicate results for these two similar alternatives.

The proposed interchange at US 378 is a diamond interchange with a single loop ramp in the northeast quadrant connecting northbound SELL to westbound US 378. The interchange at US 701 is a partial cloverleaf interchange with a loop on-ramp in the northwest quadrant connecting westbound US 701 to southbound SELL, and a loop on-ramp in the southeast quadrant connecting eastbound US 701 to northbound SELL. The interchange of Alternative 12&13 with SC 707 is a proposed Single Point Urban Interchange (SPUI) that is located approximately 4,400 feet south of Holmestown Road. Alternative 12&13 terminates 0.7 miles southwest of the US 17 and Holmestown Road intersection at a directional interchange that incorporates a loop on-ramp from northbound US 17 to northbound SELL. Alternative 12&13 is 31.2 miles long. Alternative 12 is shown in **Figure 3.12** and Alternative 13 is shown in **Figure 3.13**.

3.9 Alternative 14

Alternative 14 begins on US 501 at the unmodified interchange with SC 22 (Conway Bypass). Instead of running along new alignment, Alternative 14 runs along a widened existing alignment of US 501 to the southeast for 5.4 miles. At this point, Alternative 14 runs along a widened existing alignment of El Bethel Road to Cates Bay Highway at which point it continues along the widened alignment of the Conway Perimeter Road to US 701. Alternative 14 continues along new alignment between US 701 and SC 544. At SC 544, the new alignment portion of Alternative 14 intersects at an at-grade intersection, with a flyover ramp from northbound SC 544 to westbound Alternative 14 provided in place of at-grade left turn lanes controlled by a traffic signal. From this intersection, Alternative 14 then follows a widened existing alignment of SC 544 for about 10.4 miles to its terminus at US 17. Alternative 14 is 24.1 miles long.

Since Alternative 14 is expected to be an upgraded arterial with multiple at-grade intersections throughout its length, freeway, merge/diverge, and weaving analyses for the alternative could not be performed. Alternative 14 is shown in **Figure 3.14**.

3.10 Alternative 15

Alternative 15 follows the same alignment as Alternative 14 between the unmodified US 501/SC 22 interchange and US 701. From that point, Alternative 15 follows a portion of the new alignment from Alternative 14 for about 1.4 miles to the southeast, and then bends to the north to intersect US 501 following the general alignment of the Academy Drive Extension. At its at-grade intersection with US 501, a flyover ramp is provided from westbound US 501 to southbound Alternative 15 in place of at-grade left turn lanes controlled by a traffic signal. Alternative 15 then continues to the east along a widened existing alignment of US 501, to a revised interchange at SC 544 Overpass. The interchange revision includes a new ramp from eastbound US 501 to southbound SC 544 Overpass

Figure 3.10 - SELL Conceptual Alternative 10

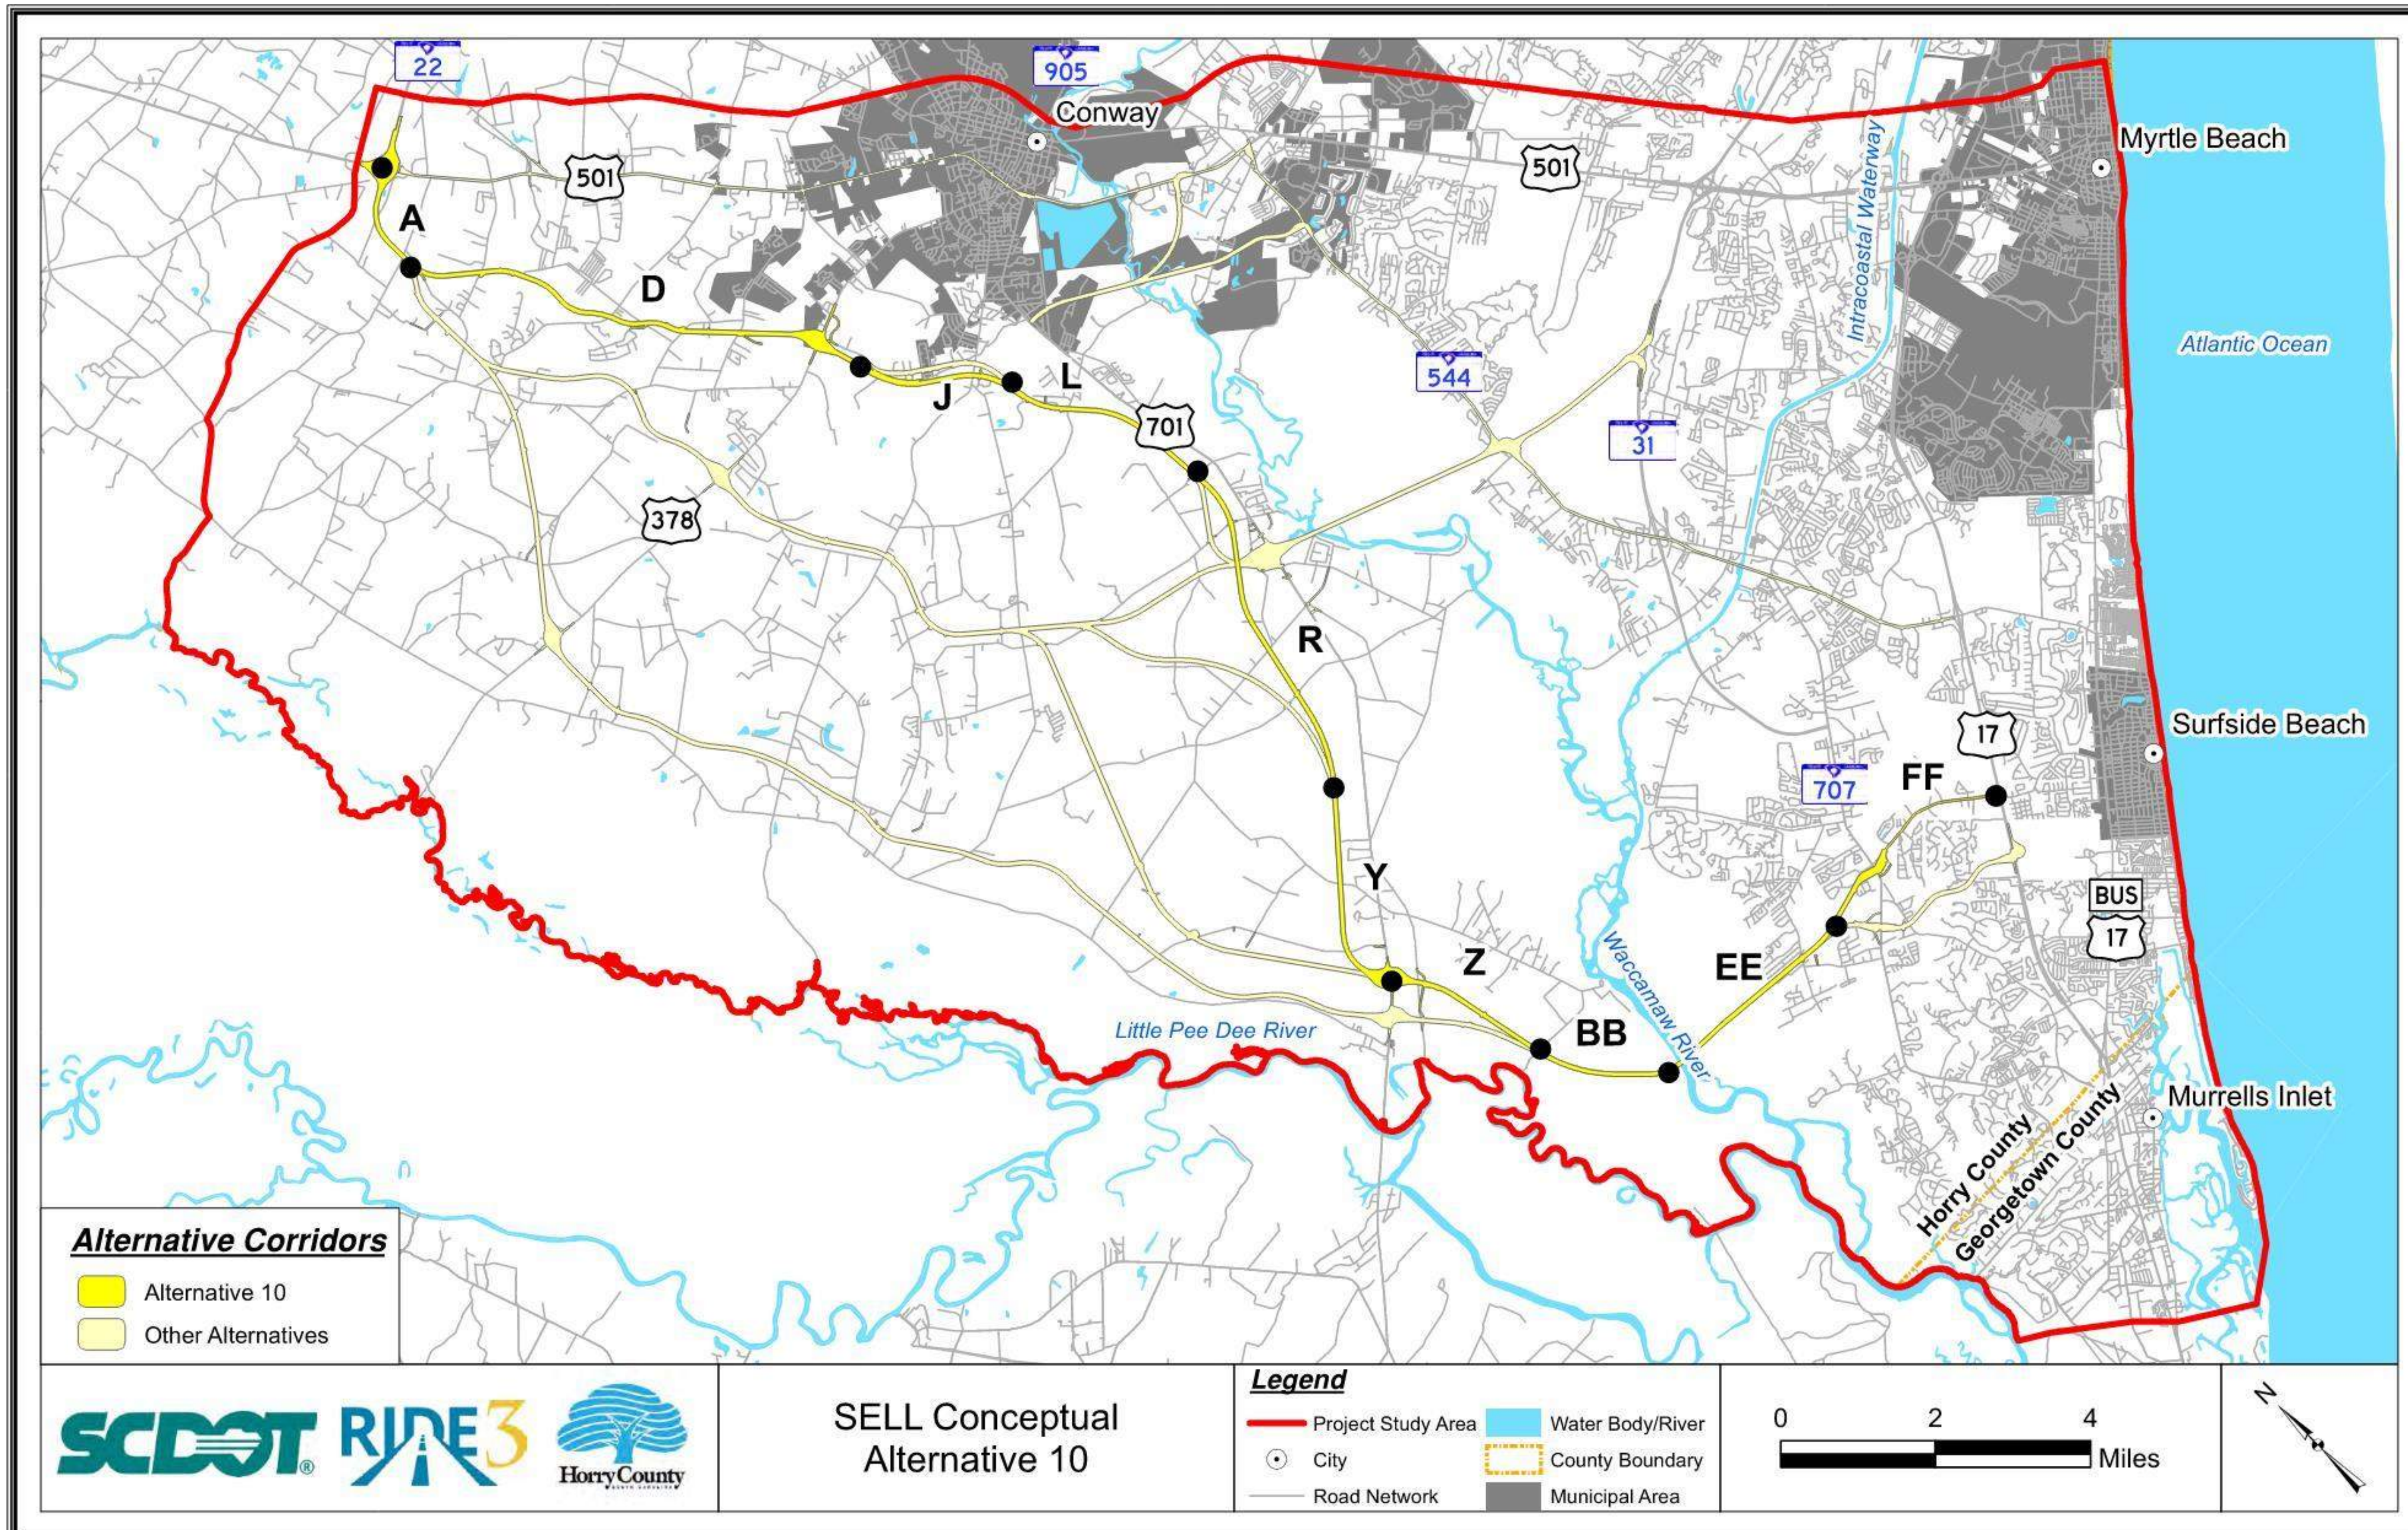

Figure 3.11 - SELL Conceptual Alternative 11

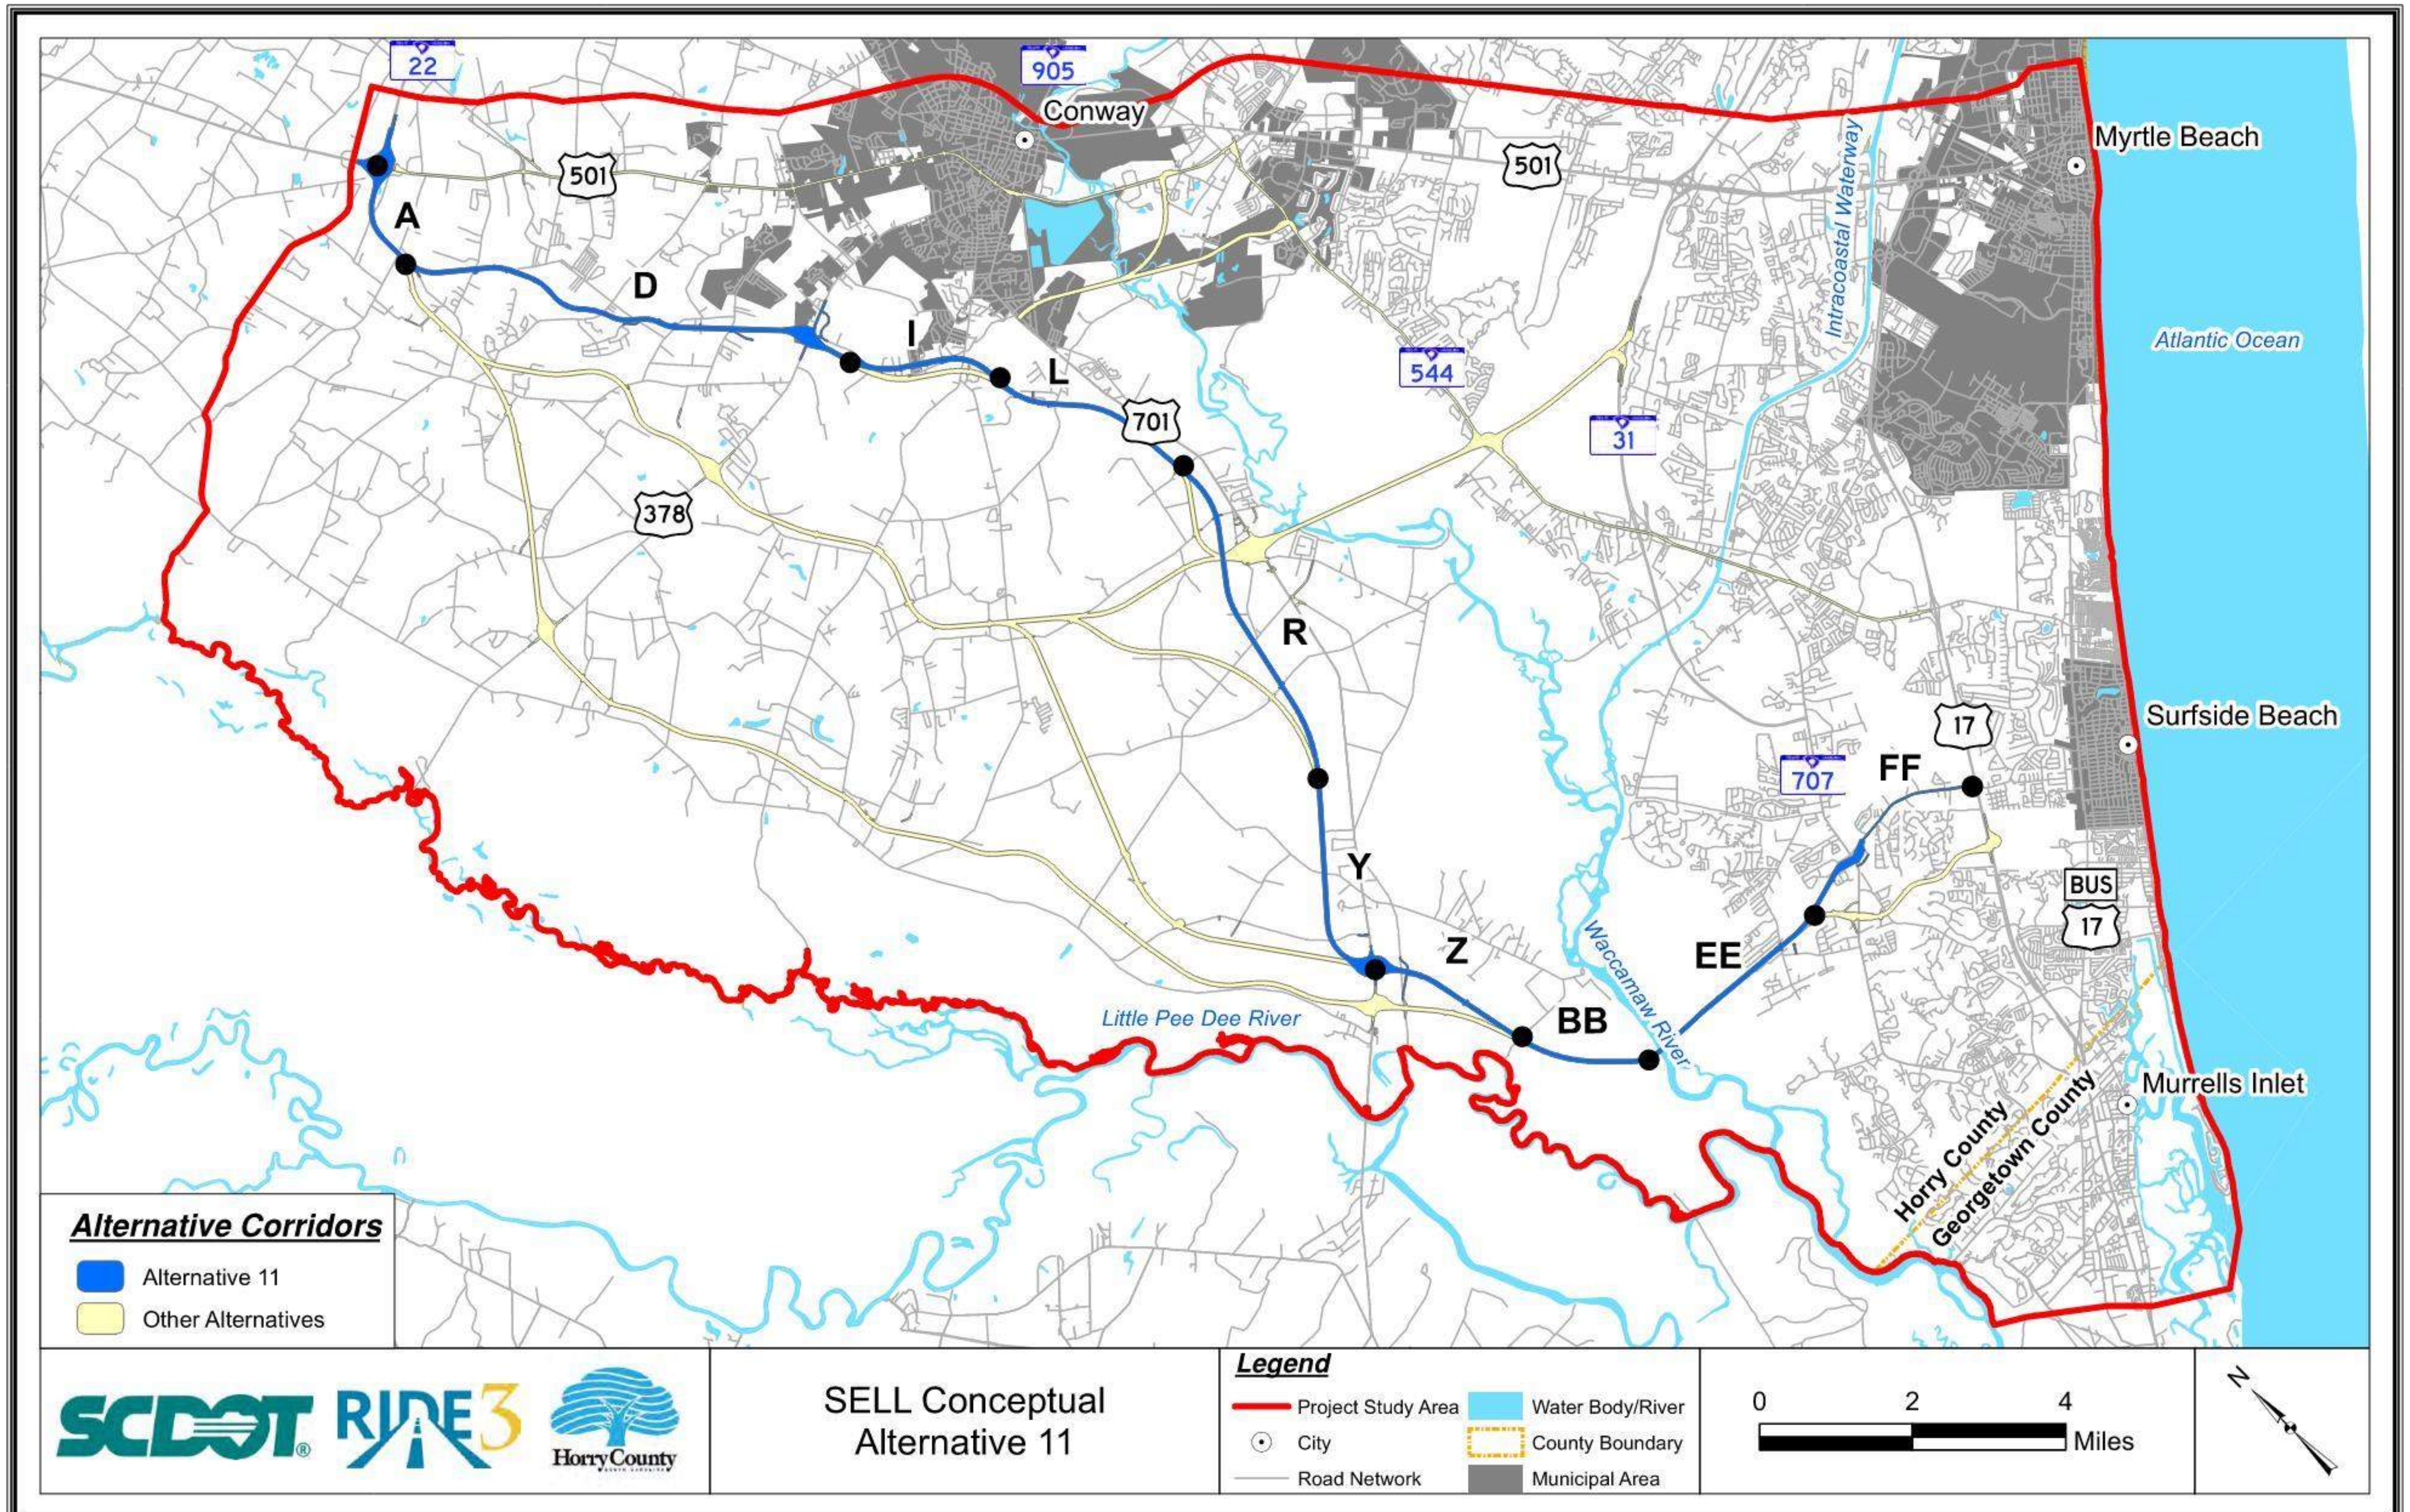

Figure 3.12 - SELL Conceptual Alternative 12

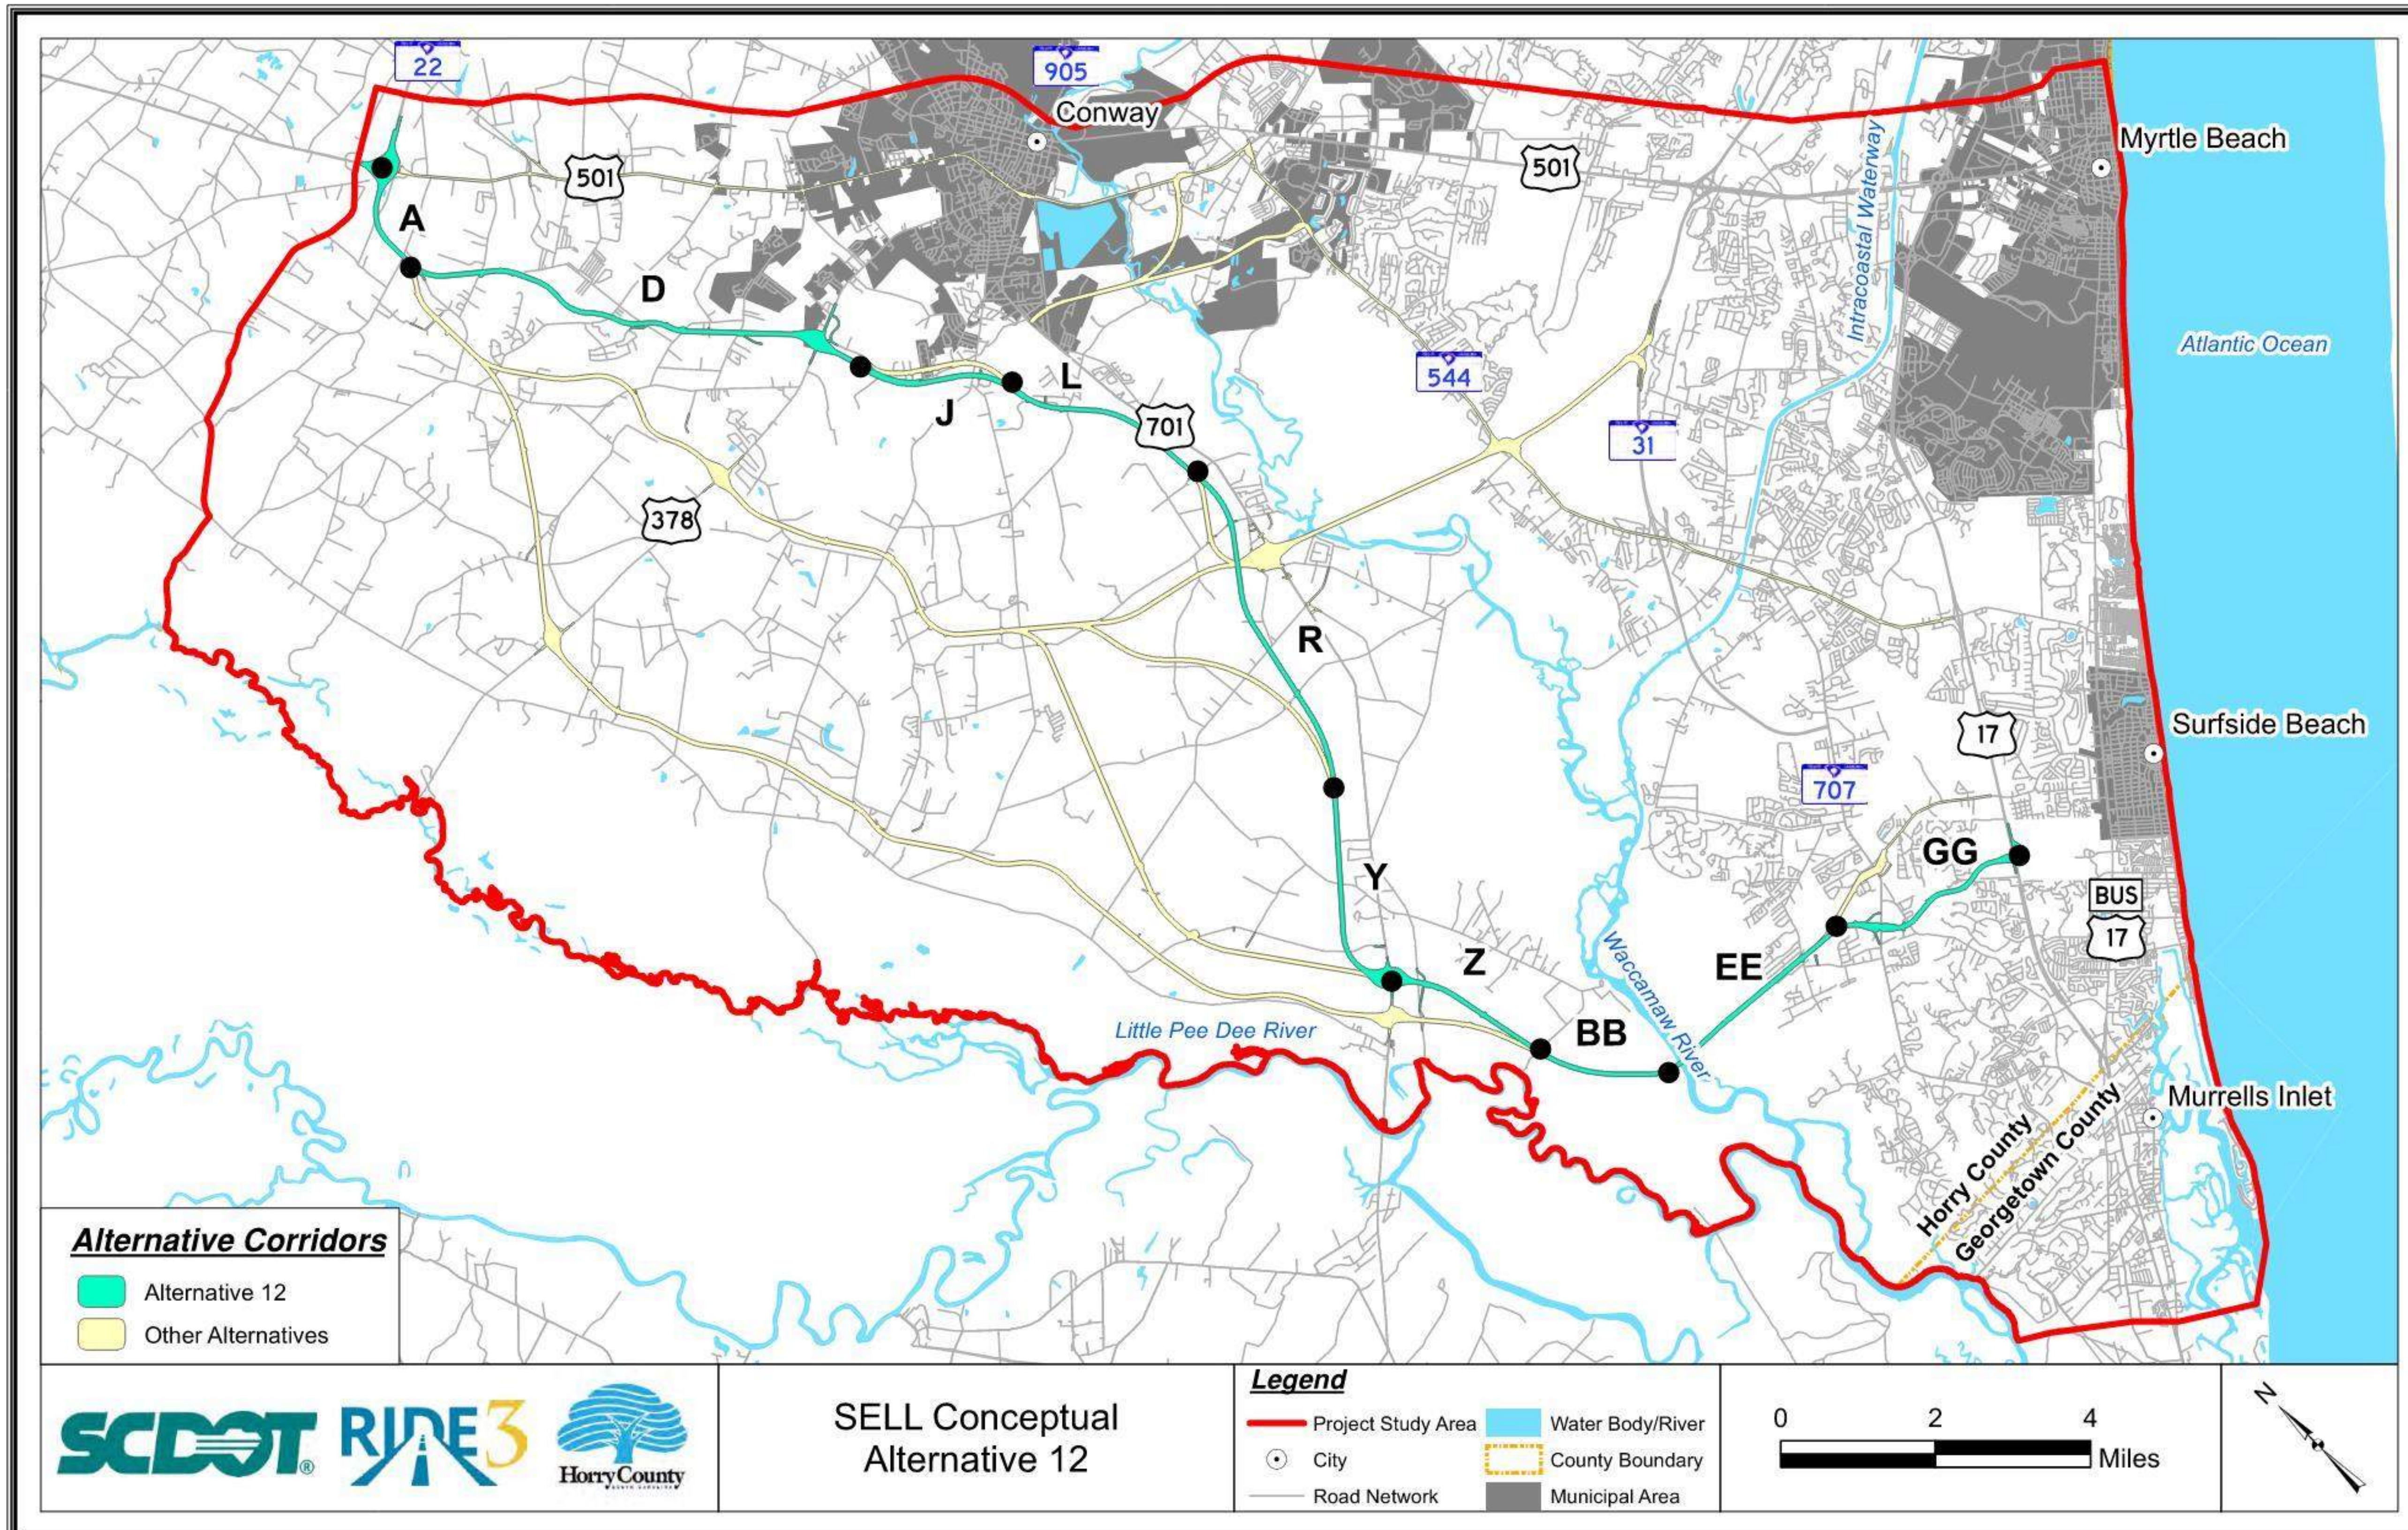

Figure 3.13 - SELL Conceptual Alternative 13

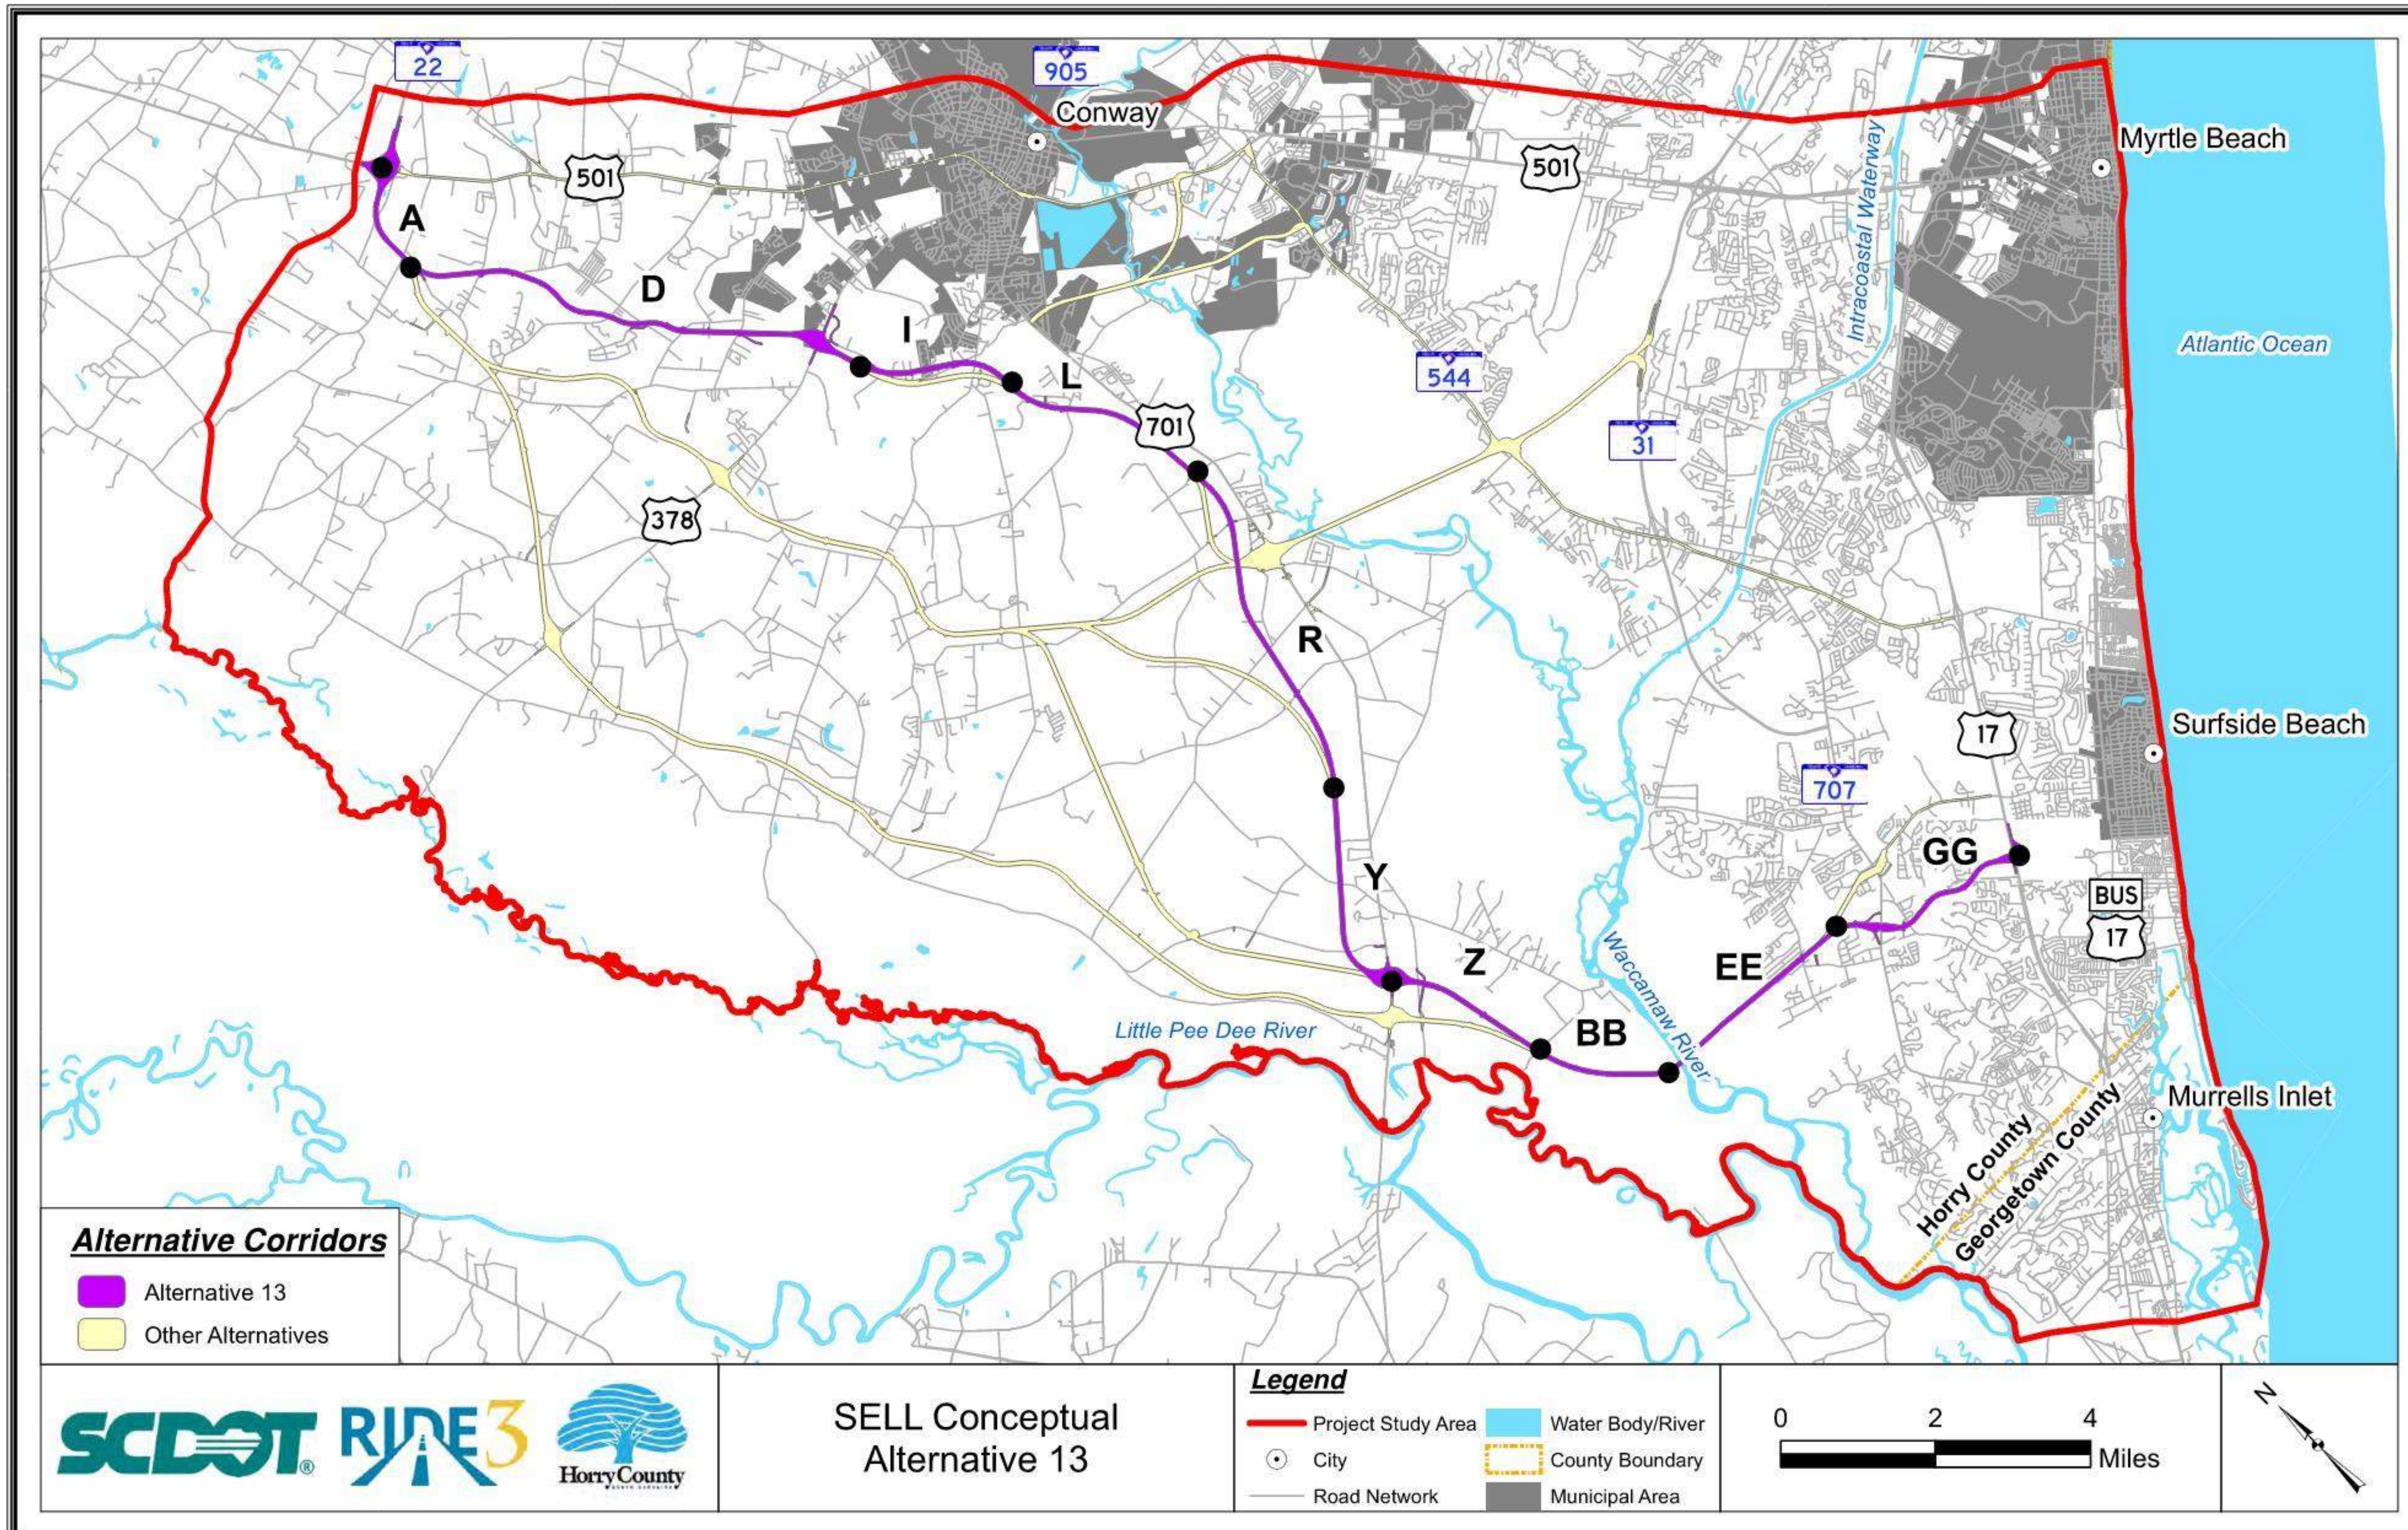

Figure 3.14 - SELL Conceptual Alignment 14

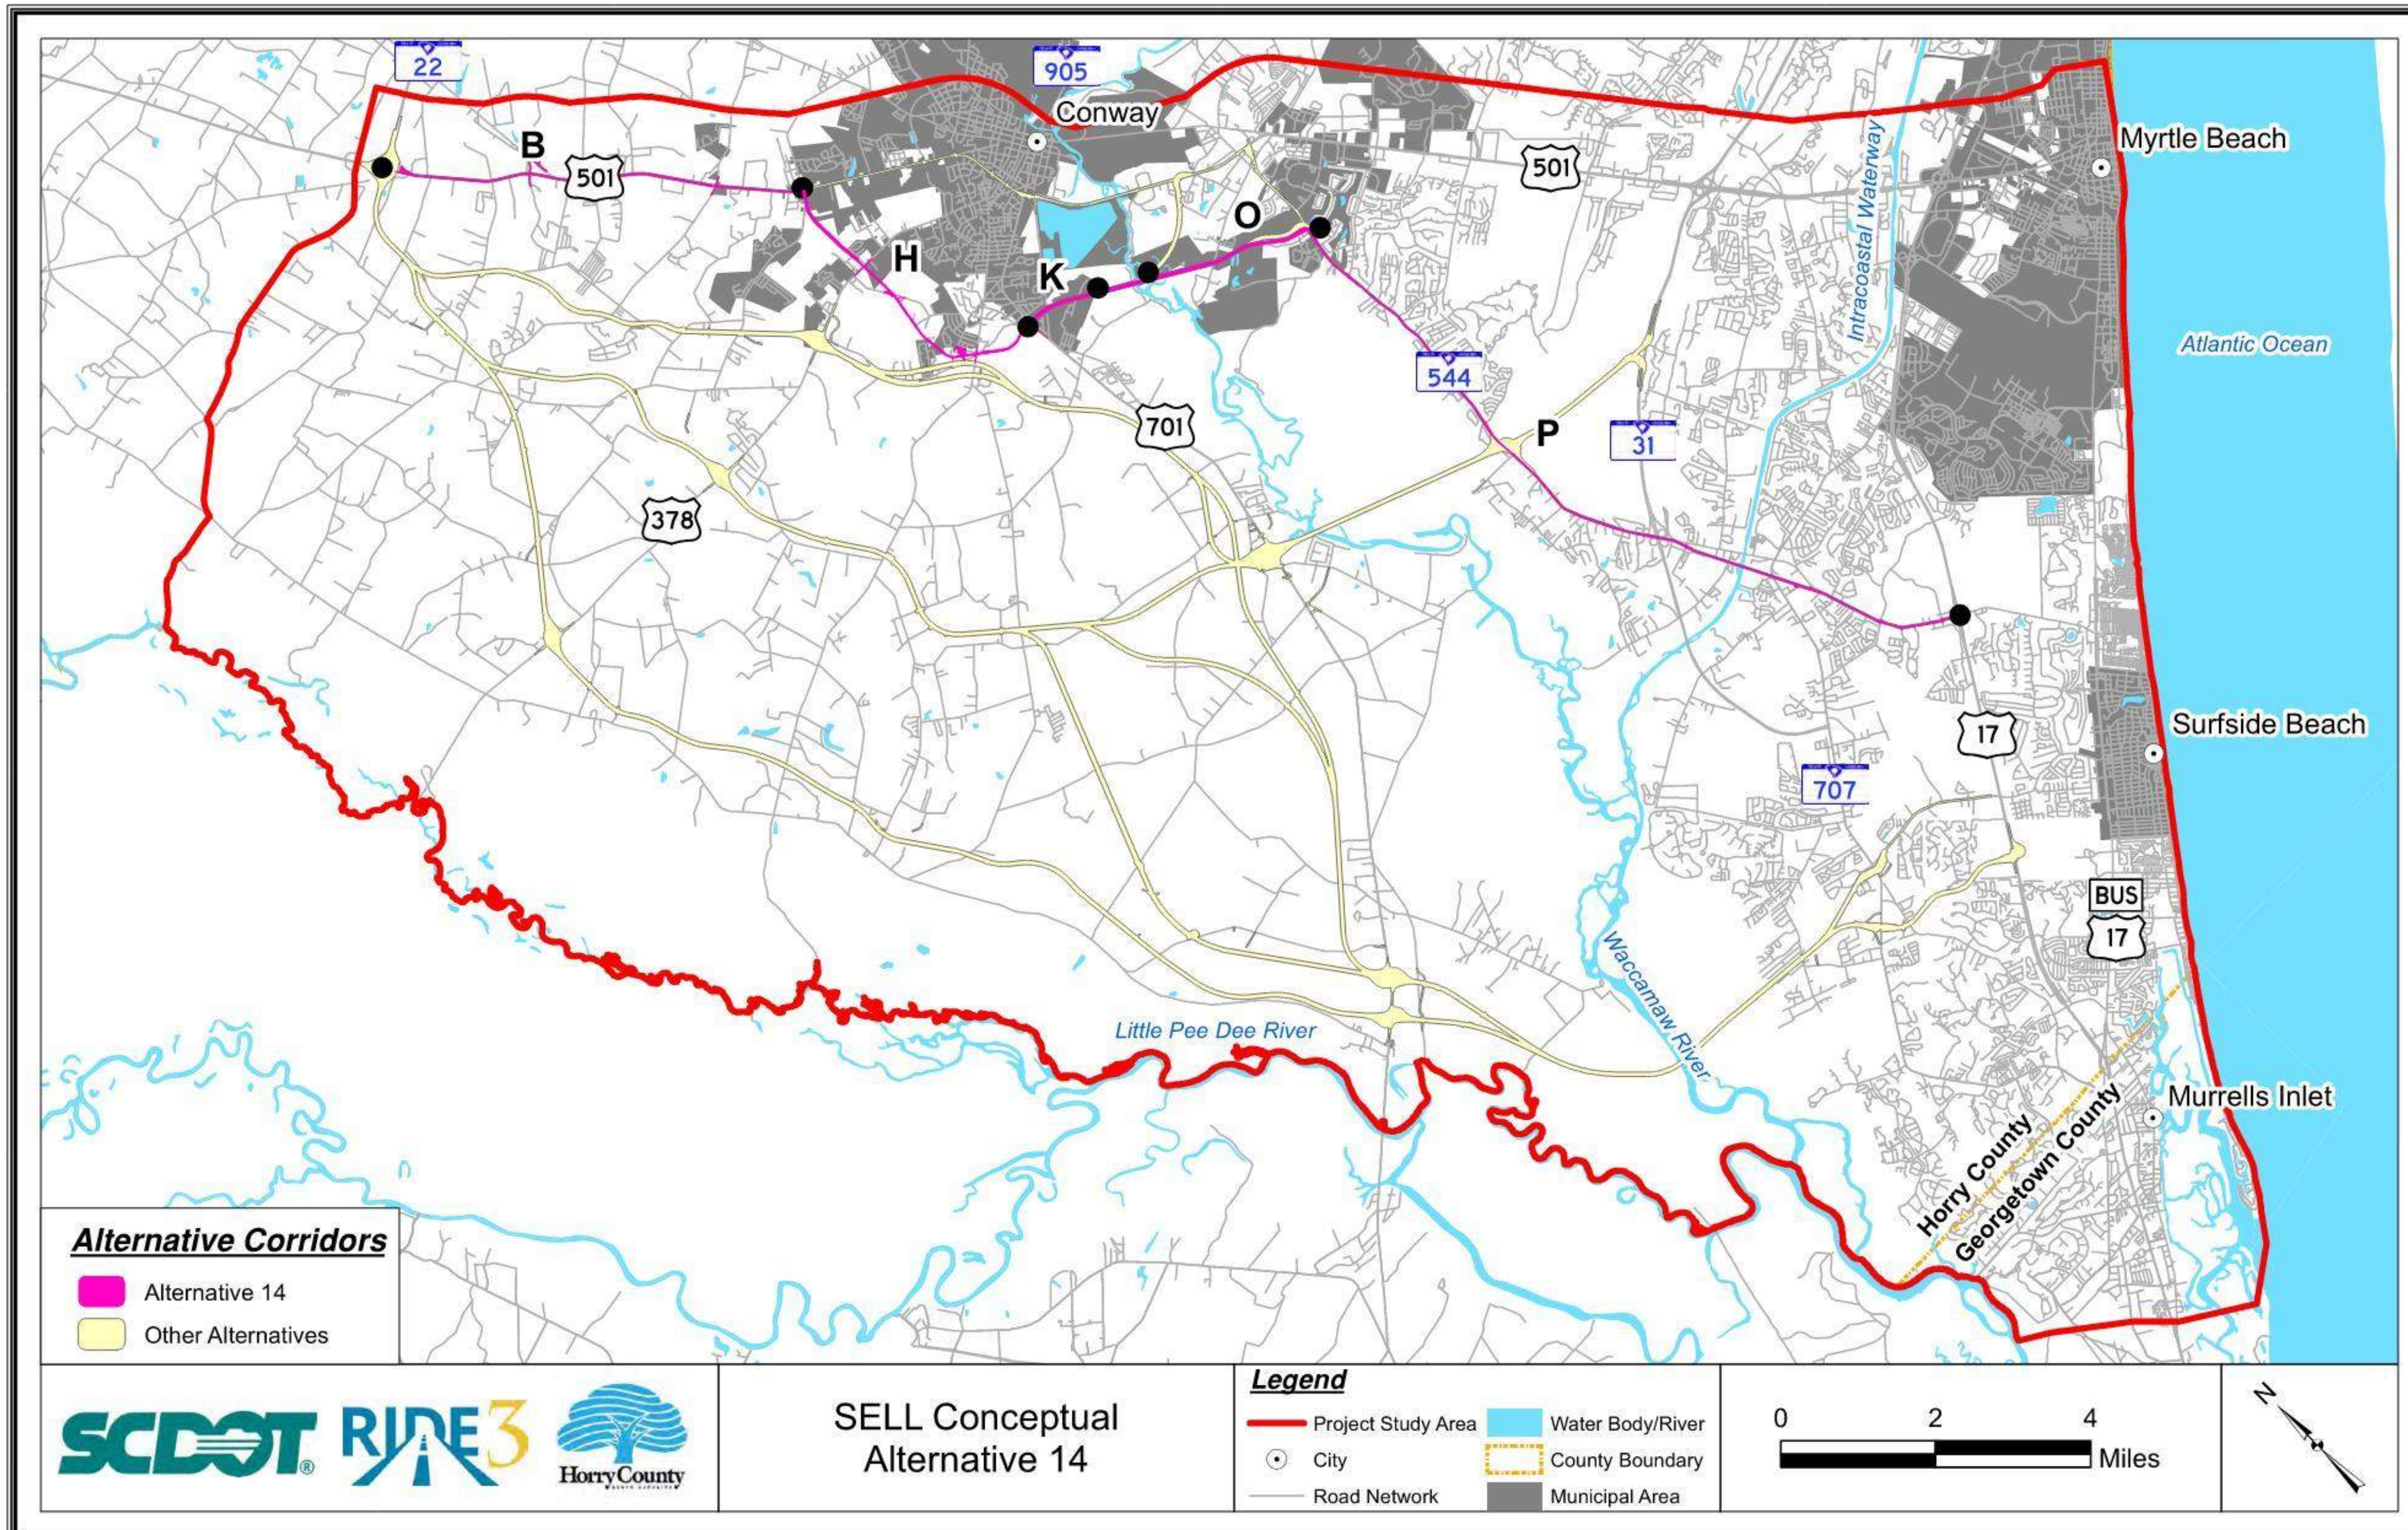

to divert traffic away from the signalized intersection of US 501 at SC 544, which is a two-lane roadway south of US 501. Alternative 15 then continues to the south along a widened existing alignment of SC 544 to its terminus at US 17. Alternative 15 is 26 miles long. Since Alternative 15 is expected to be an upgraded arterial with multiple at-grade intersections throughout its length, freeway, merge/diverge, and weaving analyses for the alternative could not be performed. Alternative 15 is shown in **Figure 3.15**.

3.11 Alternative 16

Alternative 16 begins at the unmodified US 501 at the SC 22 interchange, then follows widened existing alignment along US 501 to the southeast direction before turning to the south on widened existing alignment along SC 544. Similar to Alternative 15, Alternative 16 includes a revised interchange at SC 544 Overpass. The interchange revision includes a new ramp from eastbound US 501 to southbound SC 544 Overpass to divert traffic away from the signalized intersection of US 501 at SC 544, which is a two-lane roadway south of US 501. Alternative 16 then continues to the south along a widened existing alignment of SC 544 to its terminus at US 17. Alternative 16 is 23.8 miles long. Since Alternative 16 is expected to have multiple at grade intersections throughout its length, freeway, merge/diverge, and weaving analyses for the alternative could not be performed. Alternative 16 is shown in **Figure 3.16**.

Figure 3.15 - SELL Conceptual Alignment 15

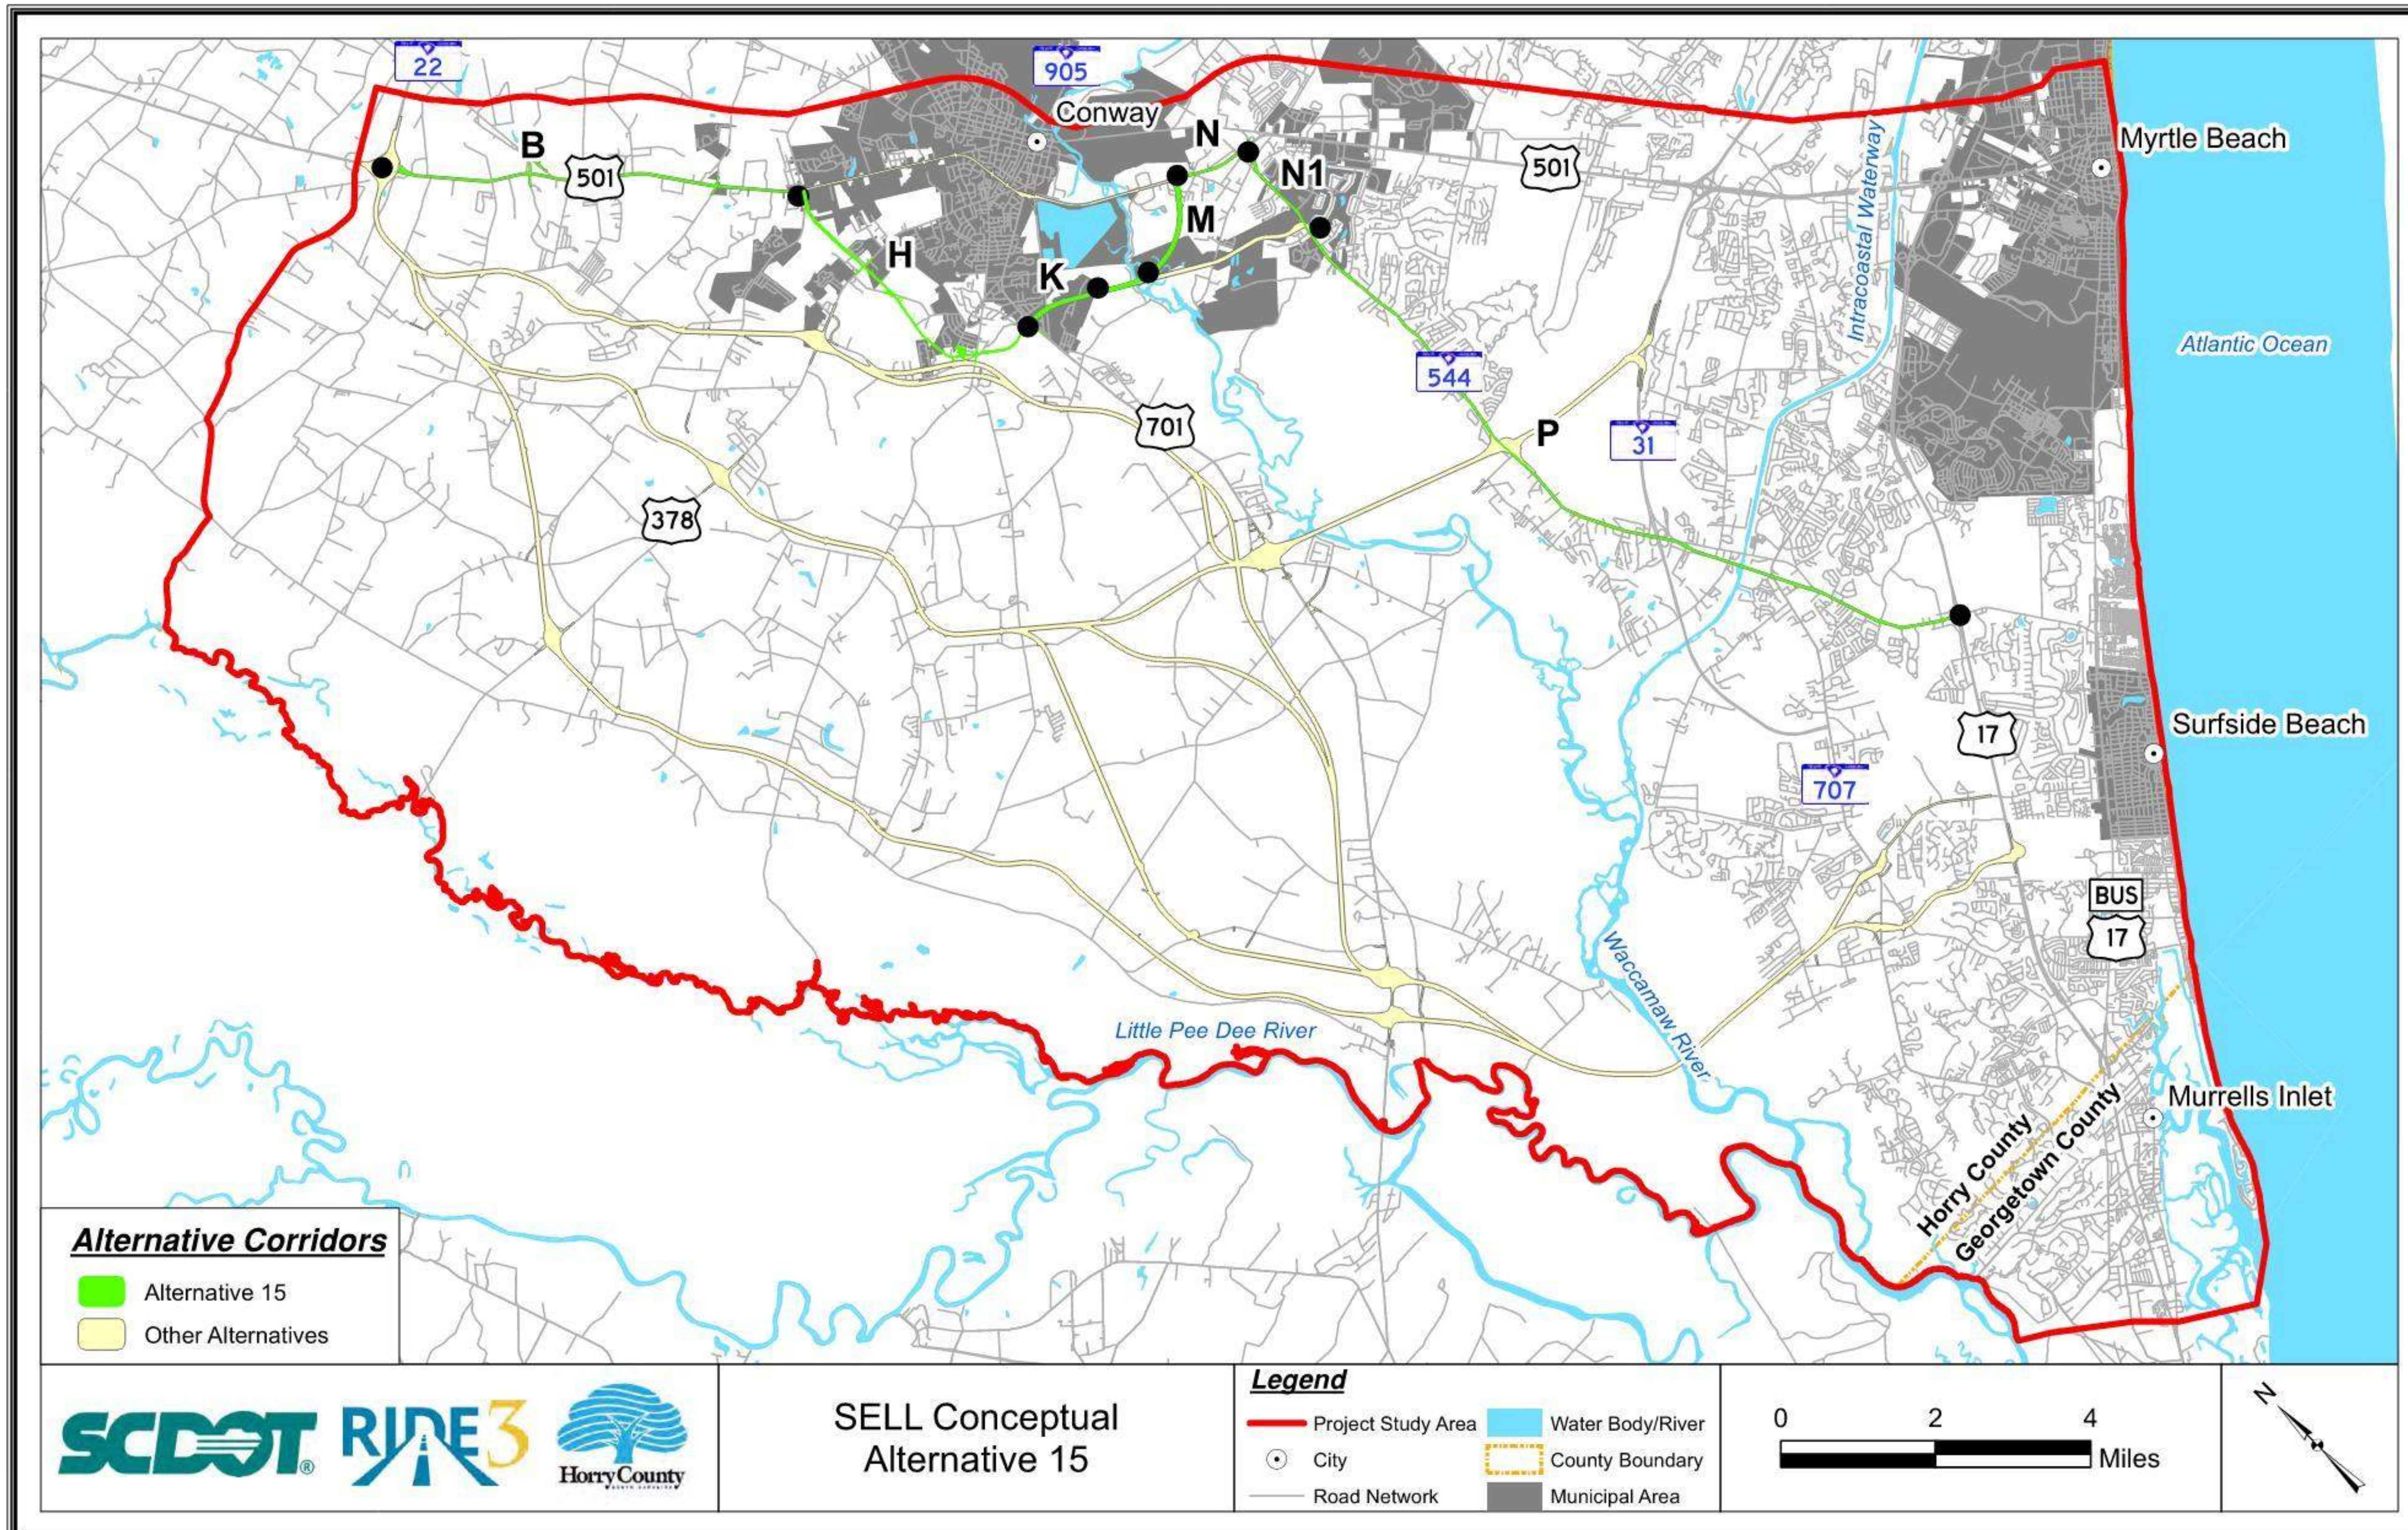

Figure 3.16 - SELL Conceptual Alignment 16

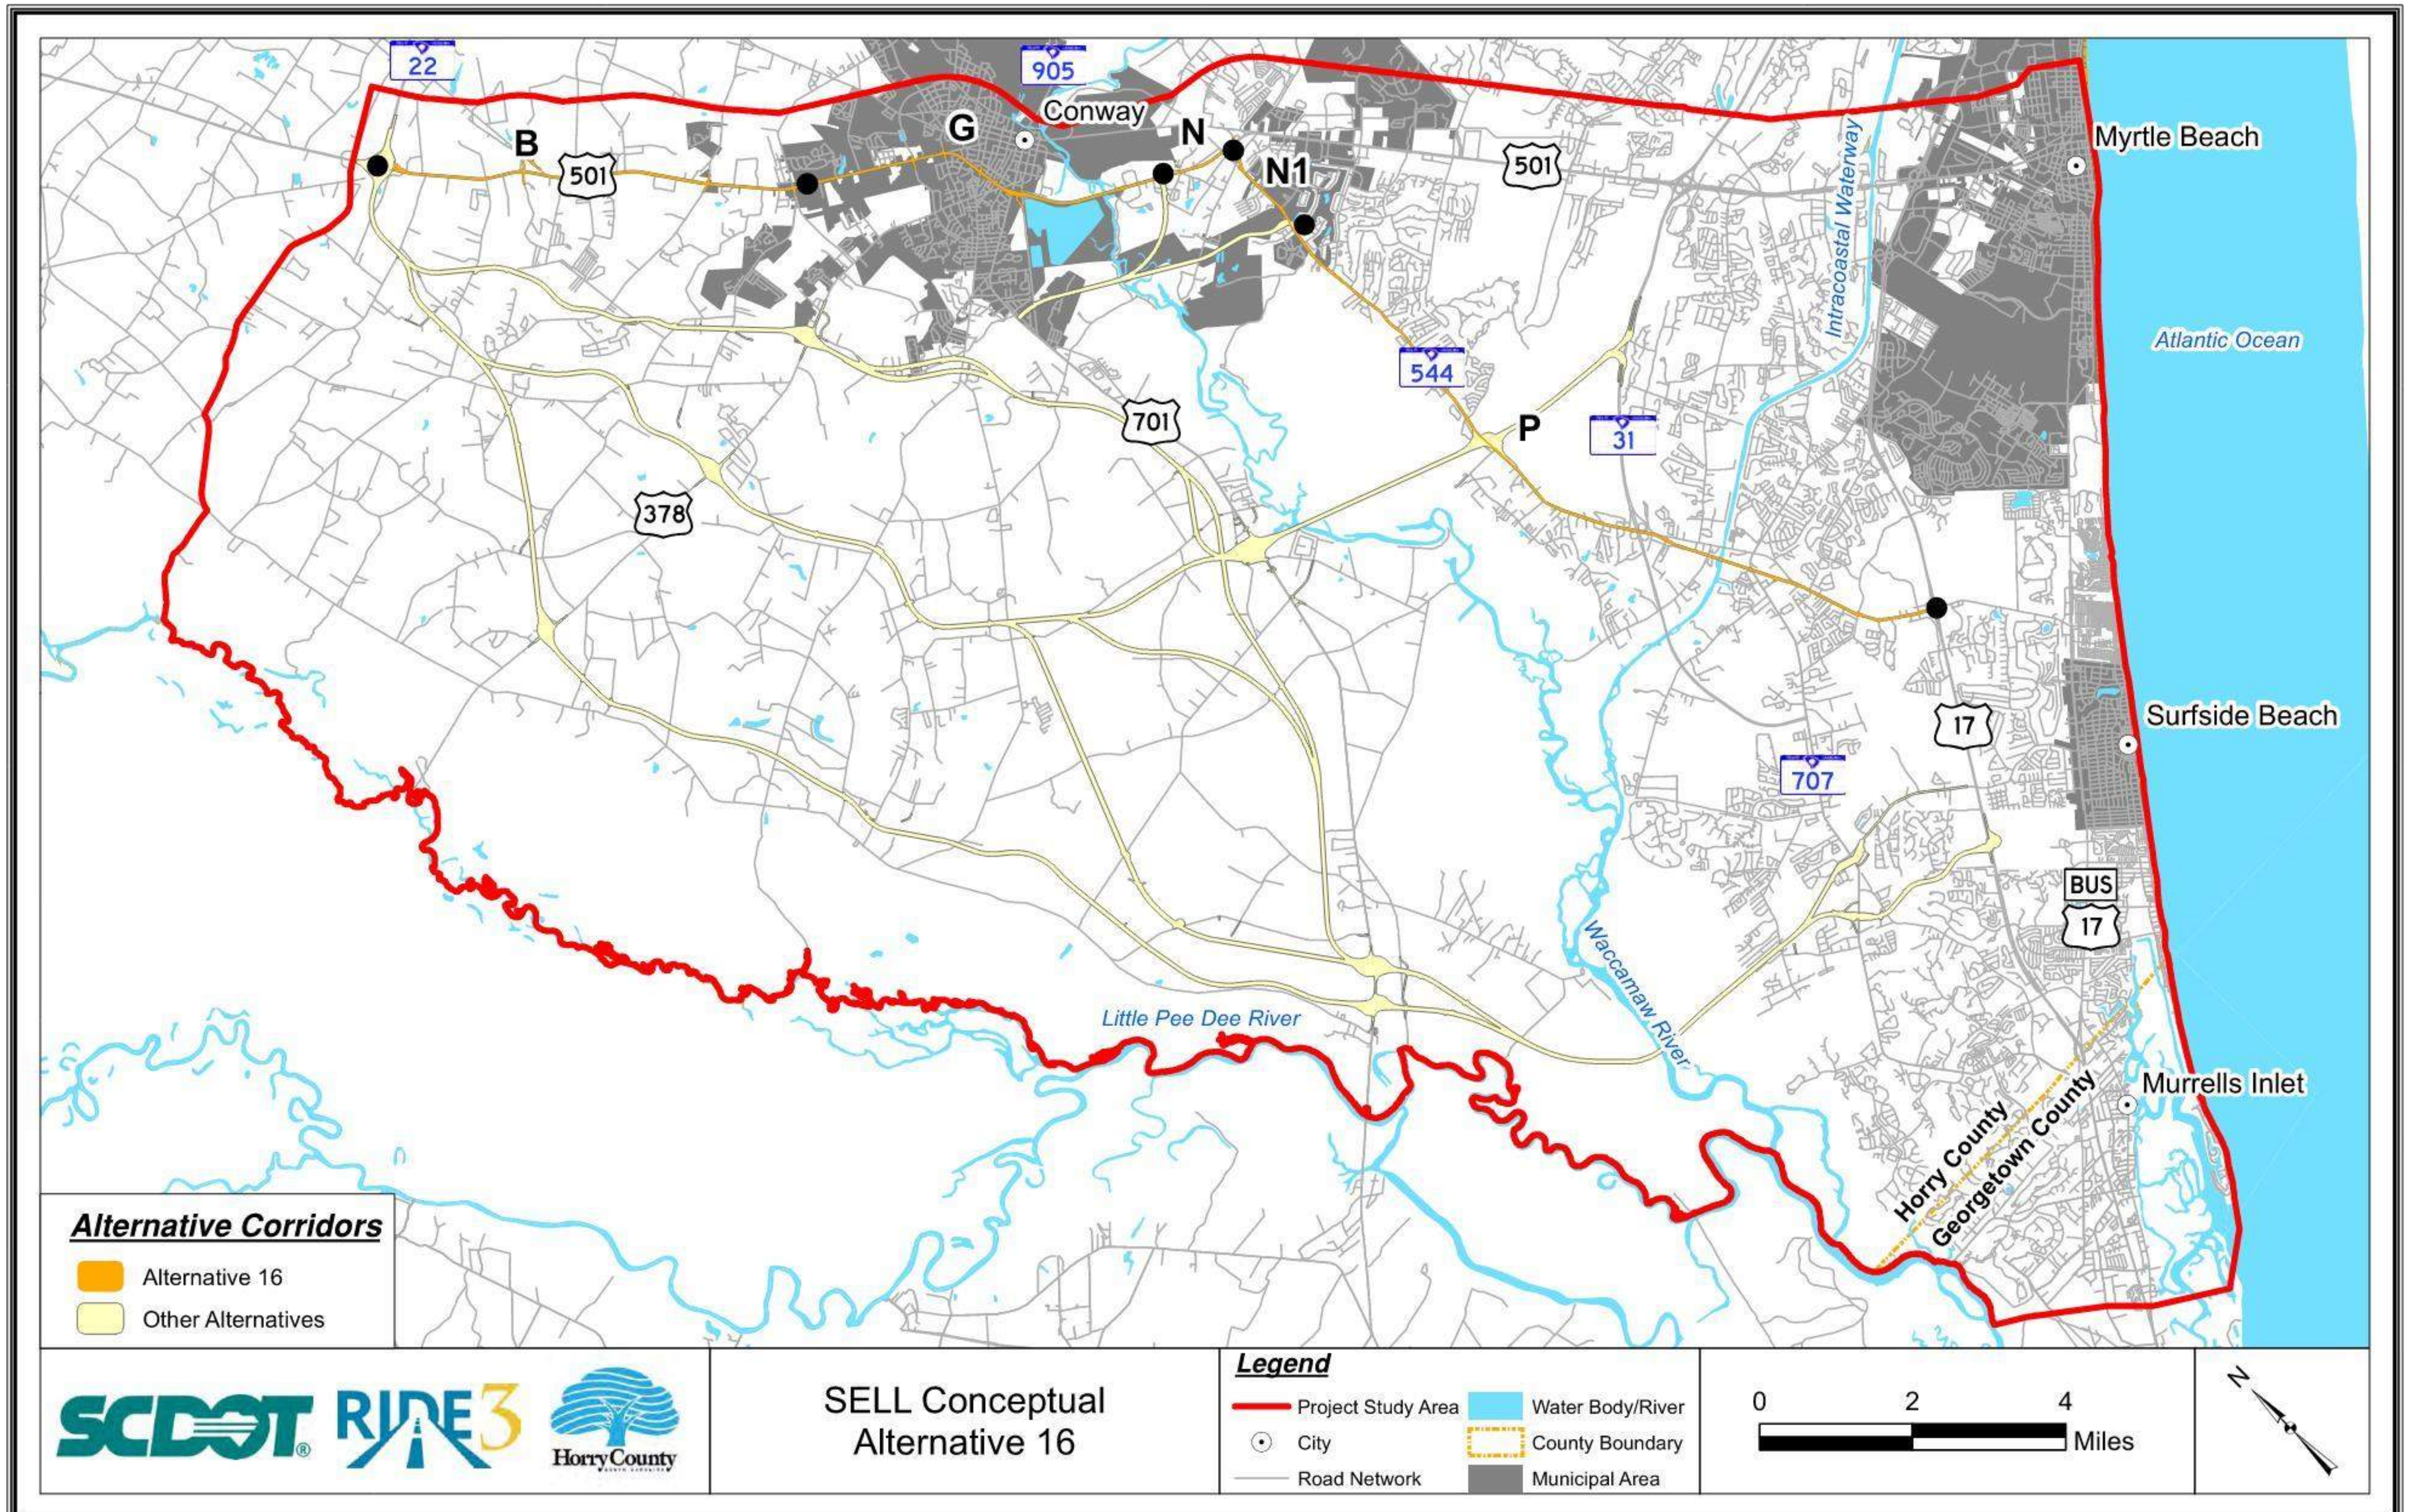

4 HCS Analysis

The HCS-based analysis of the new alignment alternatives for the proposed new alignment SELL Alternatives (SELL Alternatives 1-13) was performed using the AM and PM design hour traffic volumes derived from the travel demand model forecasts, the CCS traffic data, and the current conceptual design elements. **Figure 4.1** and **Figure 4.2** depict the design hour volumes on schematic depictions of the alternatives and the interchange configurations. As a result of similarities in the travel demand modeling of several of the alternatives, the estimated design-hour volumes used in the HCS-based analyses were identical for the following alternatives:

- Alternatives 3 and 5
- Alternatives 4 and 6
- Alternatives 8 and 9
- Alternatives 10 and 11
- Alternatives 12 and 13

4.1 HCS Analysis Assumptions

The analysis of basic freeway segments within the study area were performed for future (2040) build conditions. The following criteria were identified and used for various inputs within the freeway segment analysis:

- To develop future (2040) traffic volumes, it was decided to use the current 2040 GSATS land use data and update the model runs in the future when 2050 land use data is developed.
- A peak hour factor of 0.90 was used for freeway segments and ramp areas.
- Based on the grades through the study area, the terrain was selected as "Level", instead of "Rolling" or "Mountainous".
- Base free-flow speed was set to 70mph along the new alignment segments.
- Number of lanes was set to 2 lanes in each direction most mainline new alignment segments, except for the mainline segment from the northbound off-ramp to US 501 where it was set to 3 lanes.
- Total Ramp Density, ramps/mi is currently set to 0.
- Lane width is set to 12 feet.
- Right side clearance is set to 10.
- Total trucks percentage is currently 10 percent.
- Driver population (the level of driver familiarity) is set to 'All Familiar'.

Figure 4.1 - Alternatives 1-6 AM and PM DHV

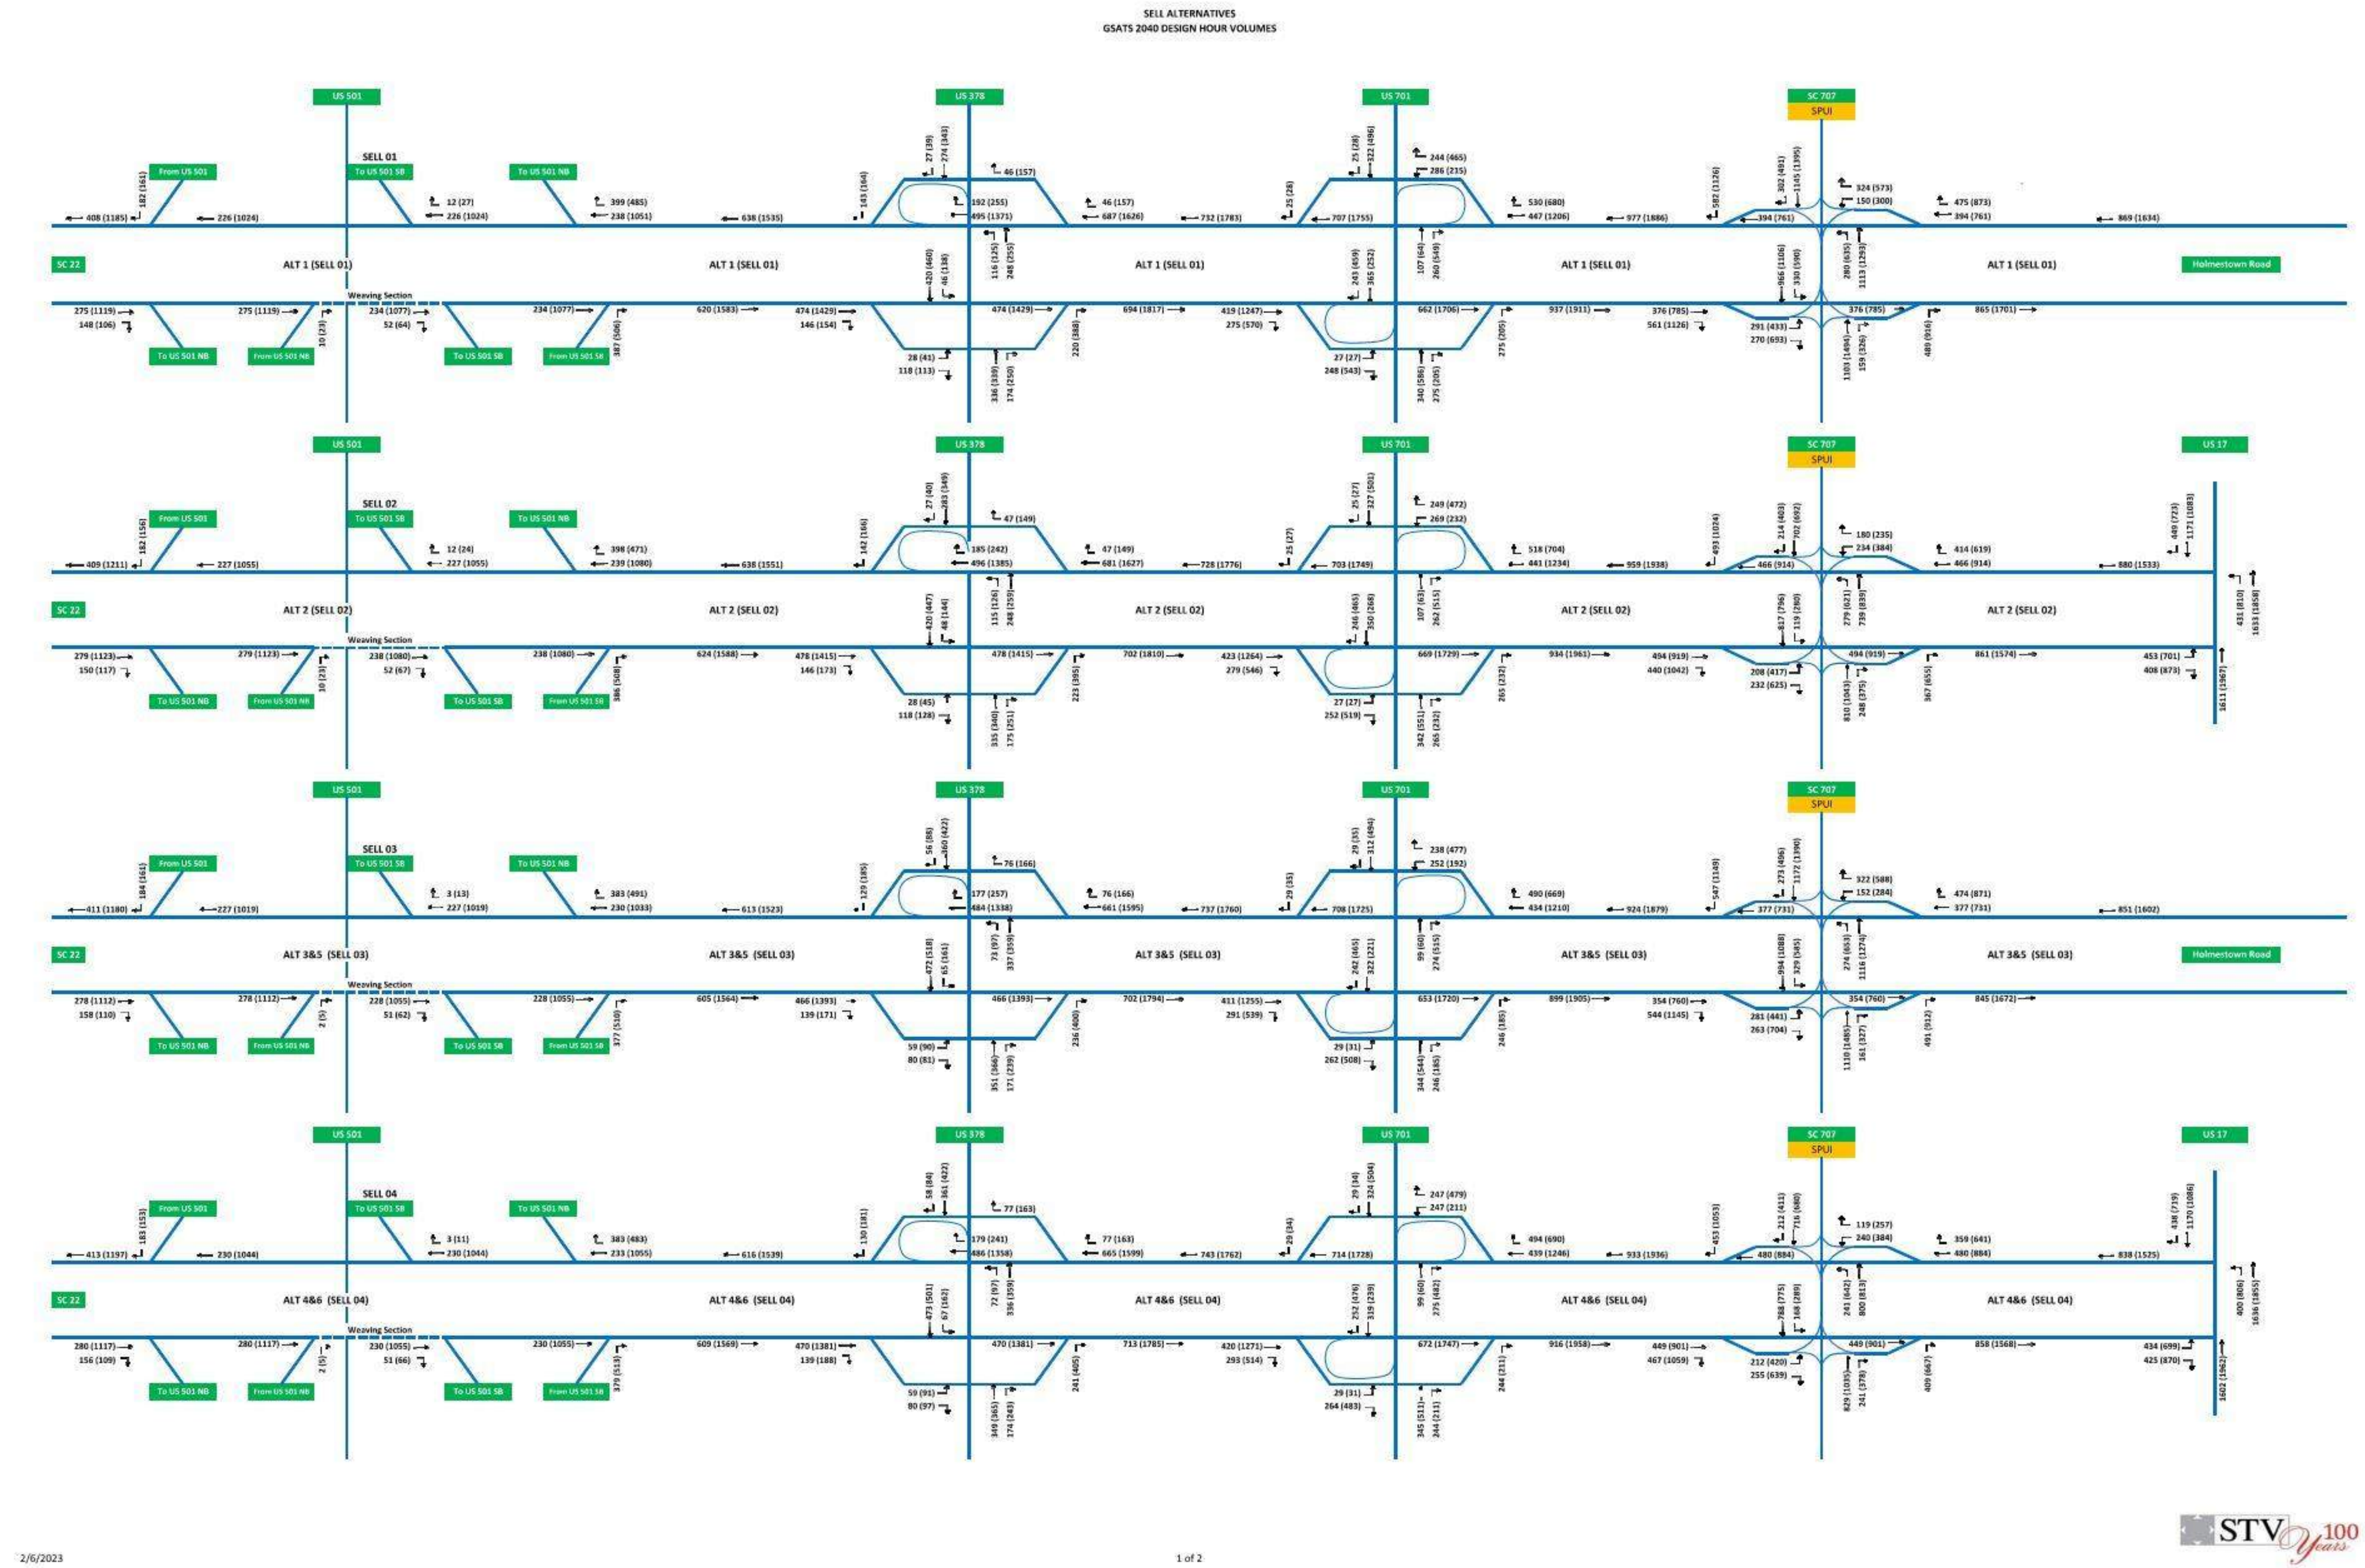

Figure 4.2 - Alternatives 7-13 AM and PM DHV

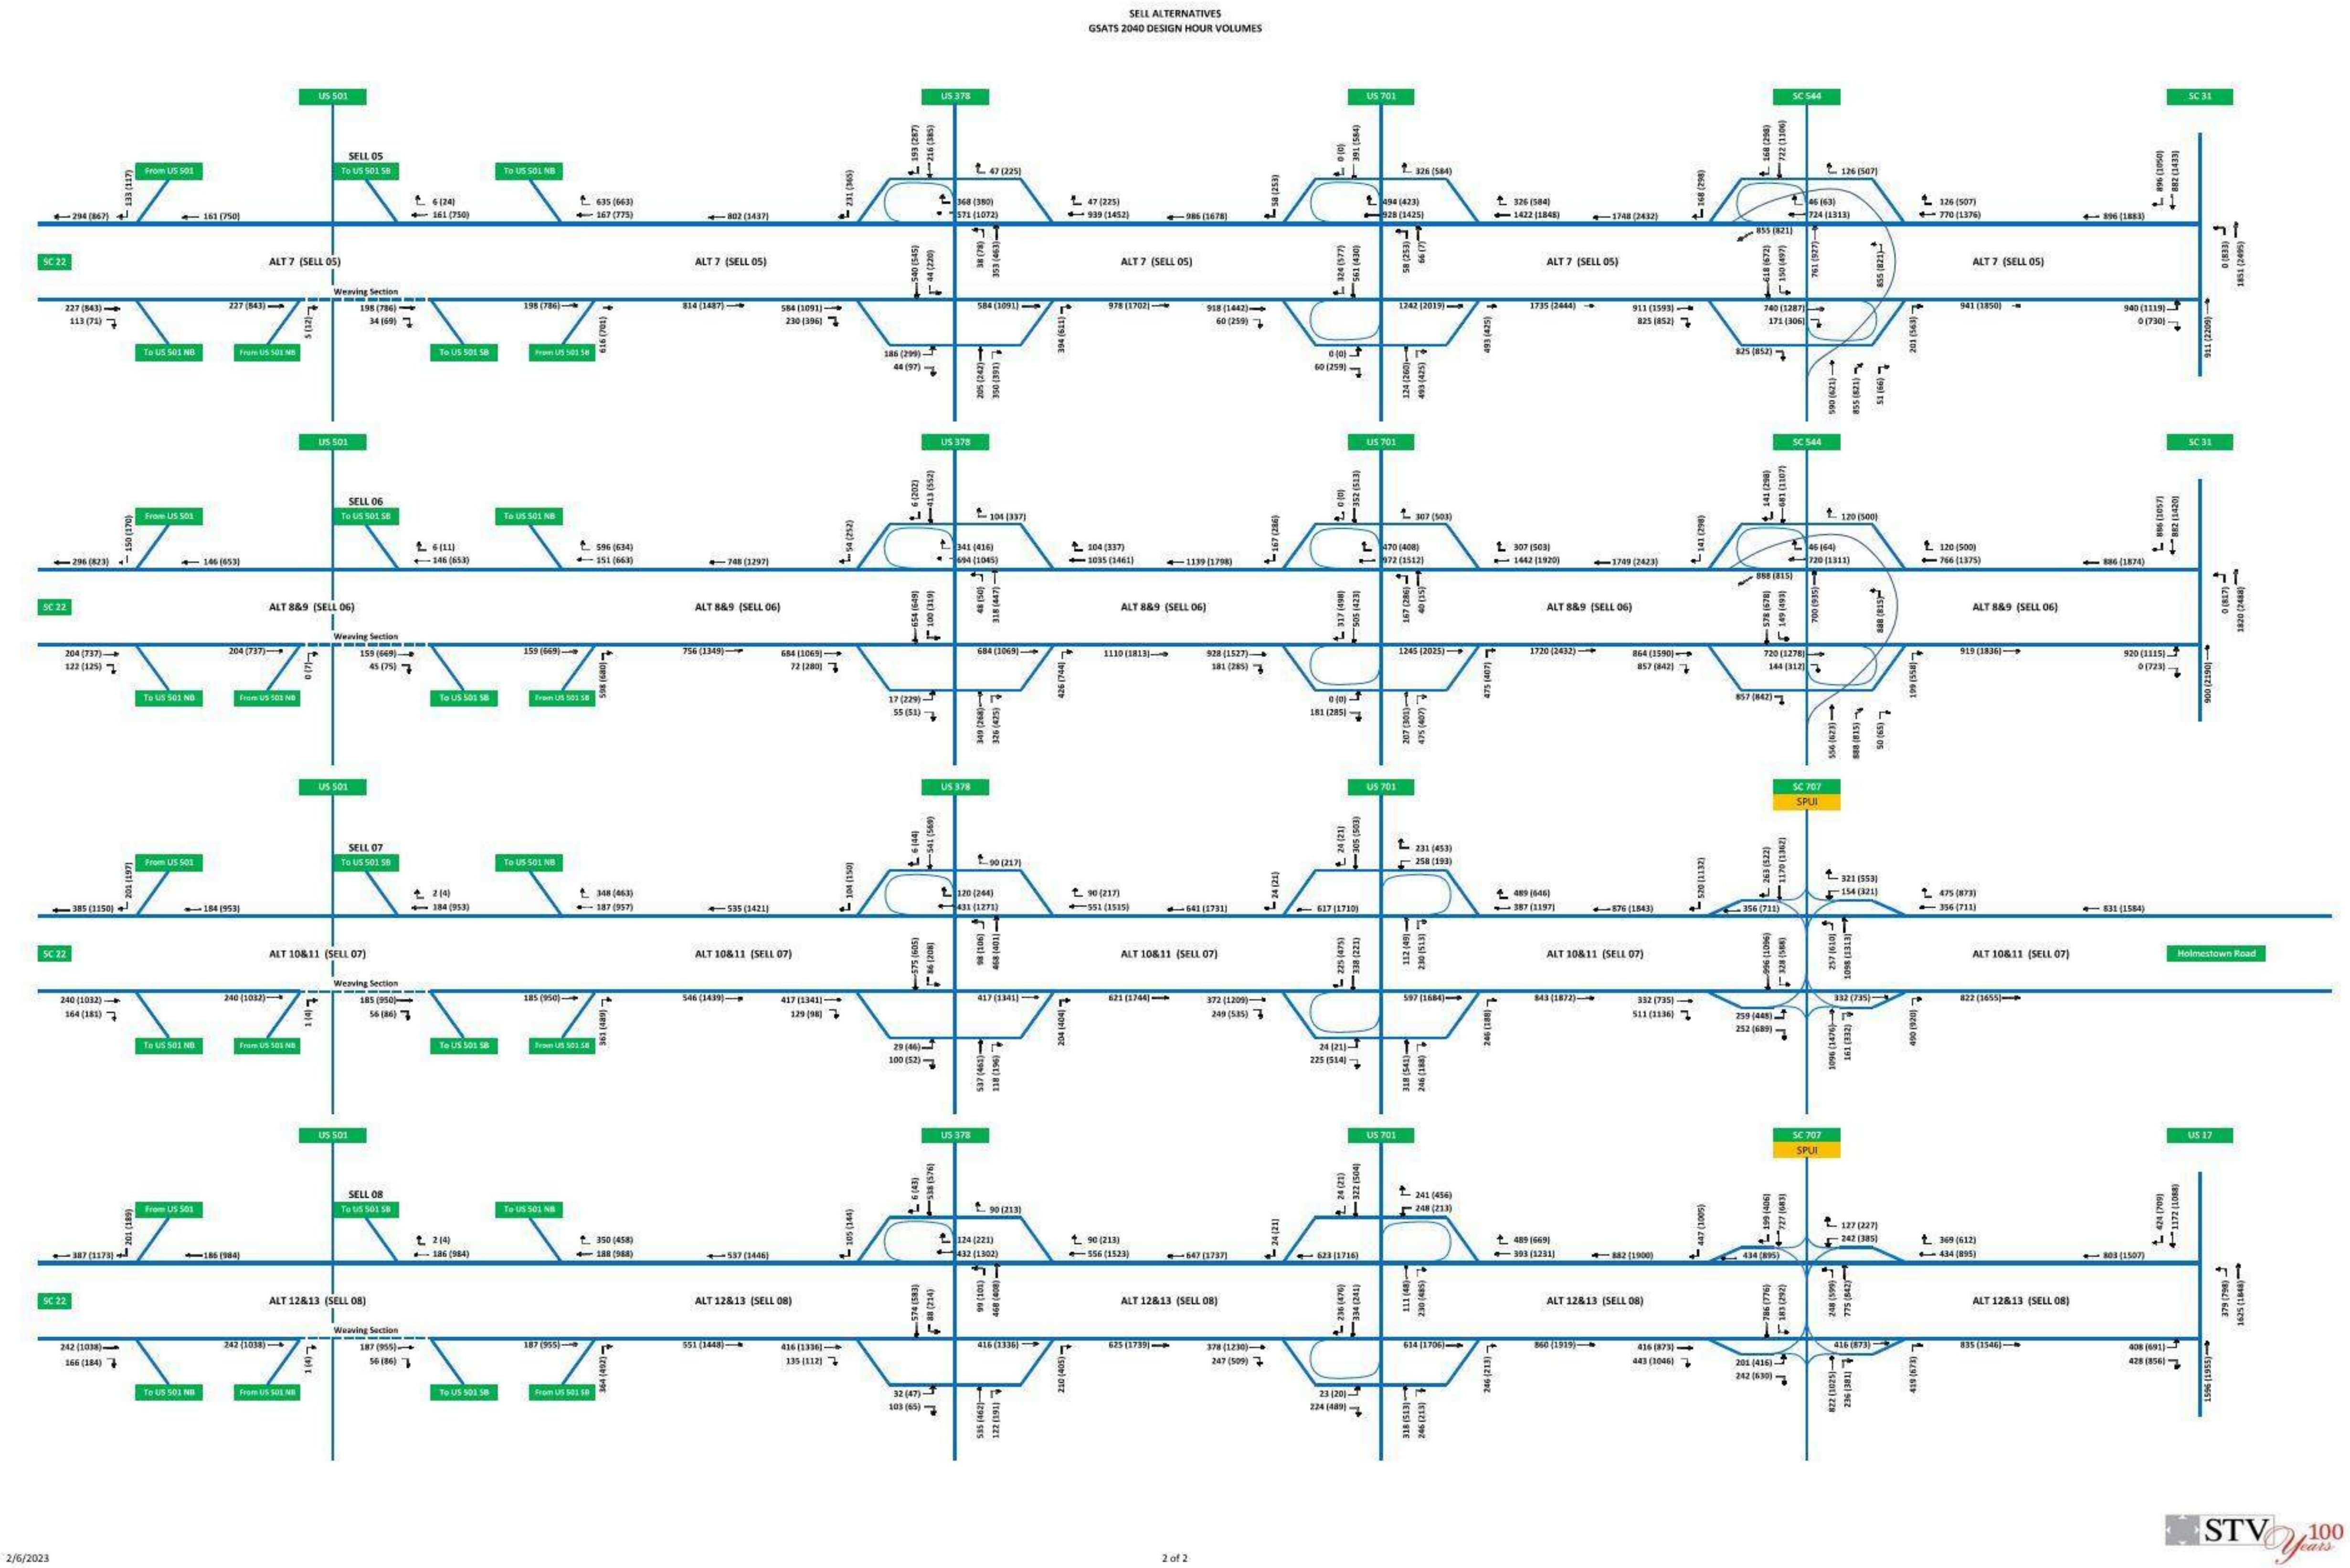

4.2 Basic Freeway Segment Analysis

The 2040 build condition analysis was performed using the future number of freeway lanes within the study area according to the conceptual designs. The 2040 build condition analysis was performed assuming the mainline SELL alignments would provide two lanes in each direction everywhere except for the segment from the northbound off-ramp to US 501 where three lanes would be provided. The Basic Freeway Segment Analysis outputs are provided in **Appendix B** and summaries of results are shown in **Table 4.1** and **Table 4.2.**

The analysis results for the freeway segments, summarized in **Table 4.1** and **Table 4.2**, indicate the following for 2040 Build Conditions:

- During the morning peak hour, all freeway segments are expected to operate at LOS B or better
- During the afternoon peak hour, all freeway segments are expected to operate at LOS C or better.

4.3 Ramp Merge Analysis

The Ramp Merge Analyses outputs are provided in **Appendix C** and the summary results are shown in **Table 4.3** and **Table 4.4**.

The analysis results for the ramp merge areas, summarized in **Table 4.3** and **Table 4.4**, indicate the following for 2040 Build Conditions:

- During the morning peak hour all merge areas are expected to operate at LOS C or better
- During the afternoon peak hour, the merge areas are expected to operate at LOS C or better except for the northbound on-ramp from SC 544, which is expected to operate at LOS D in Alternative 7.

4.4 Ramp Diverge Analysis

The Ramp Diverge Analyses are also provided in **Appendix D** and the summary results are shown in **Table 4.5** and **Table 4.6**.

The analysis results for the ramp diverge areas, summarized in **Table 4.5** and **Table 4.6**, indicate the following for 2040 Build Conditions:

- During the morning peak hour, all of the off-ramp diverge areas operate at LOS B or better.
- During the afternoon peak hour, all of the off-ramp diverge areas operate at LOS C or better.

4.5 Weave Analysis

There is only one weaving area within the network in the westbound/southbound direction between the loop ramps at the US 501/SC 22/SELL interchange. The weaving section is created between the movement of traffic from the loop on-ramp from northbound US 501 to westbound SC 22/SELL and the loop off-ramp from westbound SC 22/SELL to southbound US 501. The analyses results of this weaving section are also provided in **Appendix E**. The summaries of the results are shown in **Table 4.7** and **Table 4.8**.

The analysis results for the weaving area, summarized in **Table 4.7** and **Table 4.8**, indicate the following for 2040 Build Conditions:

- During the morning peak hour, the weaving area is expected to operate at LOS A.
- During the afternoon peak hour, the weaving area is expected to operate at LOS A or LOS B.

5 Interchange Arterial Analysis

The operation of the arterial roadways was analyzed using Synchro/SimTraffic at the interchanges for the new SELL alternatives along US 378, US 701, and SC 707, for the proposed interchanges on the arterial widening alternatives 14, 15 and 16 on SC 544, US 501 and for the modification to the existing interchange at SC 544/US 501. The analysis was based on the DHV volumes derived from the GSATS travel demand model forecasts (as shown in **Figure 4.1** and **Figure 4.2**) and the conceptual interchange configurations. As the concepts are developed further in the future, actual traffic volume data should be collected and used to calibrate and refine the traffic analysis.

The analyses were intended to identify any potential operating issues that may require adjustment to the number of lanes and/or assumed traffic control at the ramp termini along the arterials. Synchro/SimTraffic analyses were not performed at the existing interchange at US 17 and Holmestown Road (Alternatives 1, 3, 5, 10 and 11) or at the interchanges that include free flow movements without traffic control. These interchanges include

- US 17 at the terminus of Alternatives 2, 4, 6, 12, and 13
- SC 31 at the terminus of Alternatives 7, 8, and 9
- SC 544 in Alternatives 7, 8, and 9

- US 501/SC 22/SELL in Alternatives 1 to 13.

Analyses for these interchanges need to be performed using more complex microsimulation analysis tools as part of the analysis of entire alternatives which is beyond the scope of this initial development and assessment of the SELL alternatives.

5.1 SC 707 Interchanges

The generic conceptual interchange configuration analyzed at SC 707 was a Single Point Urban Interchange (SPUI). Diverging Diamond Interchange configurations were also investigated preliminarily, but it was found that the SPUI interchange concepts generally provided better operation at the signal-controlled intersections within the alternative. No interchanges are present at SC 707 in the new alignment Alternatives 7, 8, and 9, or in the improved arterial Alternatives 14, 15 and 16.

The proposed SPUI configuration at SC 707 provides dual left turn lanes and two through lanes on northbound and southbound SC 707 at the SPUI intersection. Dual left turn lanes and dual right turn lanes are provided on each off-ramp to the SPUI. On the entrance ramps, dual on-ramp lanes from the left turns from SC 707 intersect a single yield-controlled lane from the right turn from SC 707. The two lane on-ramps merge into a single lane before entering the SELL alignment. The proposed SPUI configuration for Alternatives 1, 3&5, and 10&11, which is located to the south of the SC 707 intersection with Holmestown Road is shown in **Figure 5.1**. The proposed SPUI configuration for Alternatives 2, 4&6, and 12&13, which is located to the north of the SC 707 intersection with Grape Arbor, is shown in **Figure 5.2**.

The results of the Synchro analysis are shown in **Table 5.1** and contained in **Appendix F**. The Synchro analysis results show that the SPUI intersection is expected to operate at LOS D during the PM peak design hour. However, reviews of the SimTraffic simulations indicated that traffic flowed relatively well without excessive queuing and with no vehicles denied entry into the network. As the concept is developed further and actual traffic volume data is obtained to refine the SPUI concept, it may be possible to reduce the number of lanes on the left and right turn ramps to/from the SELL alternatives.

Table 5.1 - SC 707 SPUI Analysis Results

SC 707 SPUI Intersection	ALT 01		ALT 02		ALT 03&05		ALT 04&06		ALT 10&11		ALT 12&13

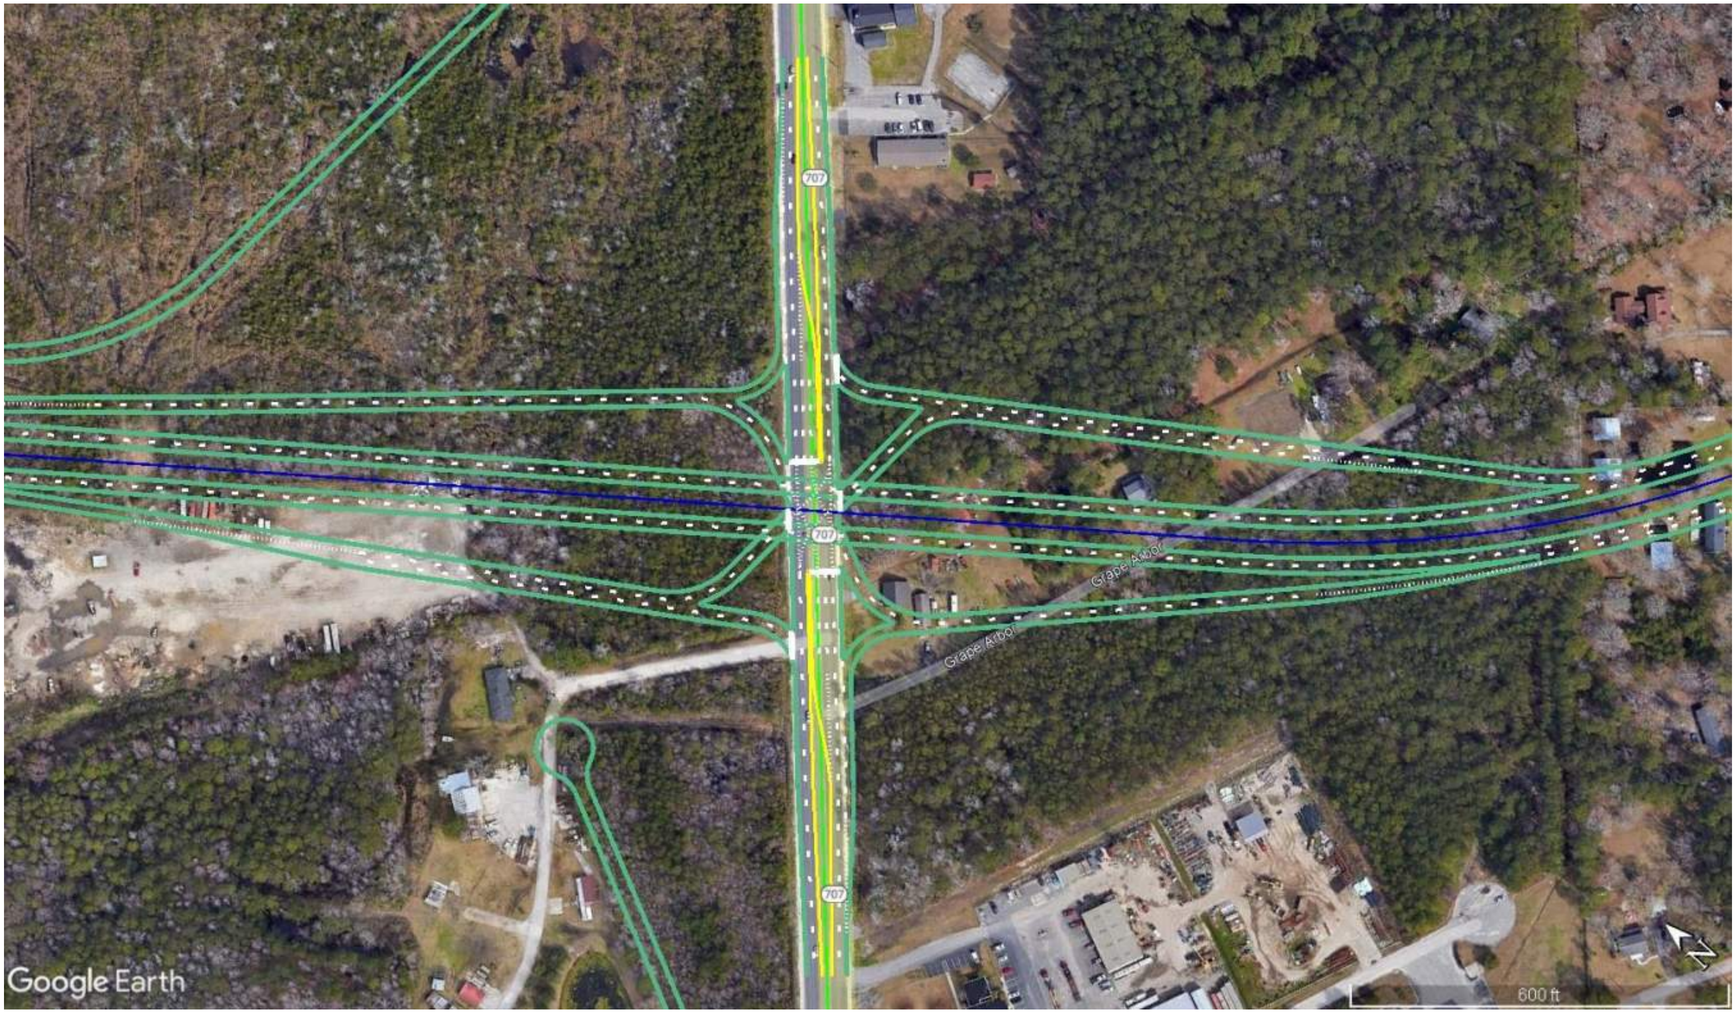
Figure 5.2 - SC 707 SPUI Configuration – Alternatives 2, 4&6, and 12&13



5.2 US 701 Interchanges

The generic conceptual interchange configuration analyzed at US 701 varies depending on the alternative. Alternatives 1 through 6 and 10 through 13 incorporate a Partial Cloverleaf interchange that has loop on-ramps from US 701 to the SELL alignment in the northwest and southwest quadrants of the interchange. For the purposes of this report, this interchange is referred to as 'US 701 ParClo 1'. Alternatives 7 through 9 incorporate a loop off-ramp from northbound SELL to westbound US 701 and a loop on-ramp from westbound US 701 to southbound SELL. This interchange is referred to as 'US 701 ParClo 2'. Both interchange concepts include diamond ramps in each quadrant. No interchanges are present at US 701 in the improved arterial Alternatives 14, 15 and 16.

5.2.1 US 701 ParClo 1

The first proposed ParClo configuration on US 701 carries one lane in each direction on the US 701 approaches to the interchange. Separate free flow right turn lanes are provided to each on-ramp, including the loop on-ramps in the northwest and southeast quadrants of the interchange. This creates a four-lane cross-section on the bridge above the SELL alignment. All movements to the on-ramps are uncontrolled. The off-ramps provide a single lane from the diverge point on the SELL alignment widening to provide separate left and right turn lanes at US 701. The northbound off-ramp right turn provides a second lane on eastbound US 701 that merges into the single eastbound lane after approximately 650 feet. The northbound off-ramp left turn and the southbound off-ramp left turn and right turn movements are controlled by stop signs. The proposed US 701 ParClo 1 configuration is shown in **Figure 5.3**.

The results of the Synchro analysis are shown in **Table 5.2** and contained in **Appendix G**. The Synchro analysis results show that the stop sign controlled off-ramp movements are expected to operate at LOS D or better. Reviews of the SimTraffic simulations indicated that traffic flowed relatively well without excessive queuing and with no vehicles denied entry into the network.

Table 5.2 - US 701 ParClo 1 Analysis Results

US 701 ParClo 1	ALT 01		ALT 02		ALT 03&05		ALT 04&06		ALT 10&11		ALT 12&13	
	AM	PM	AM	PM	AM	PM	AM	PM	AM	PM	AM	PM

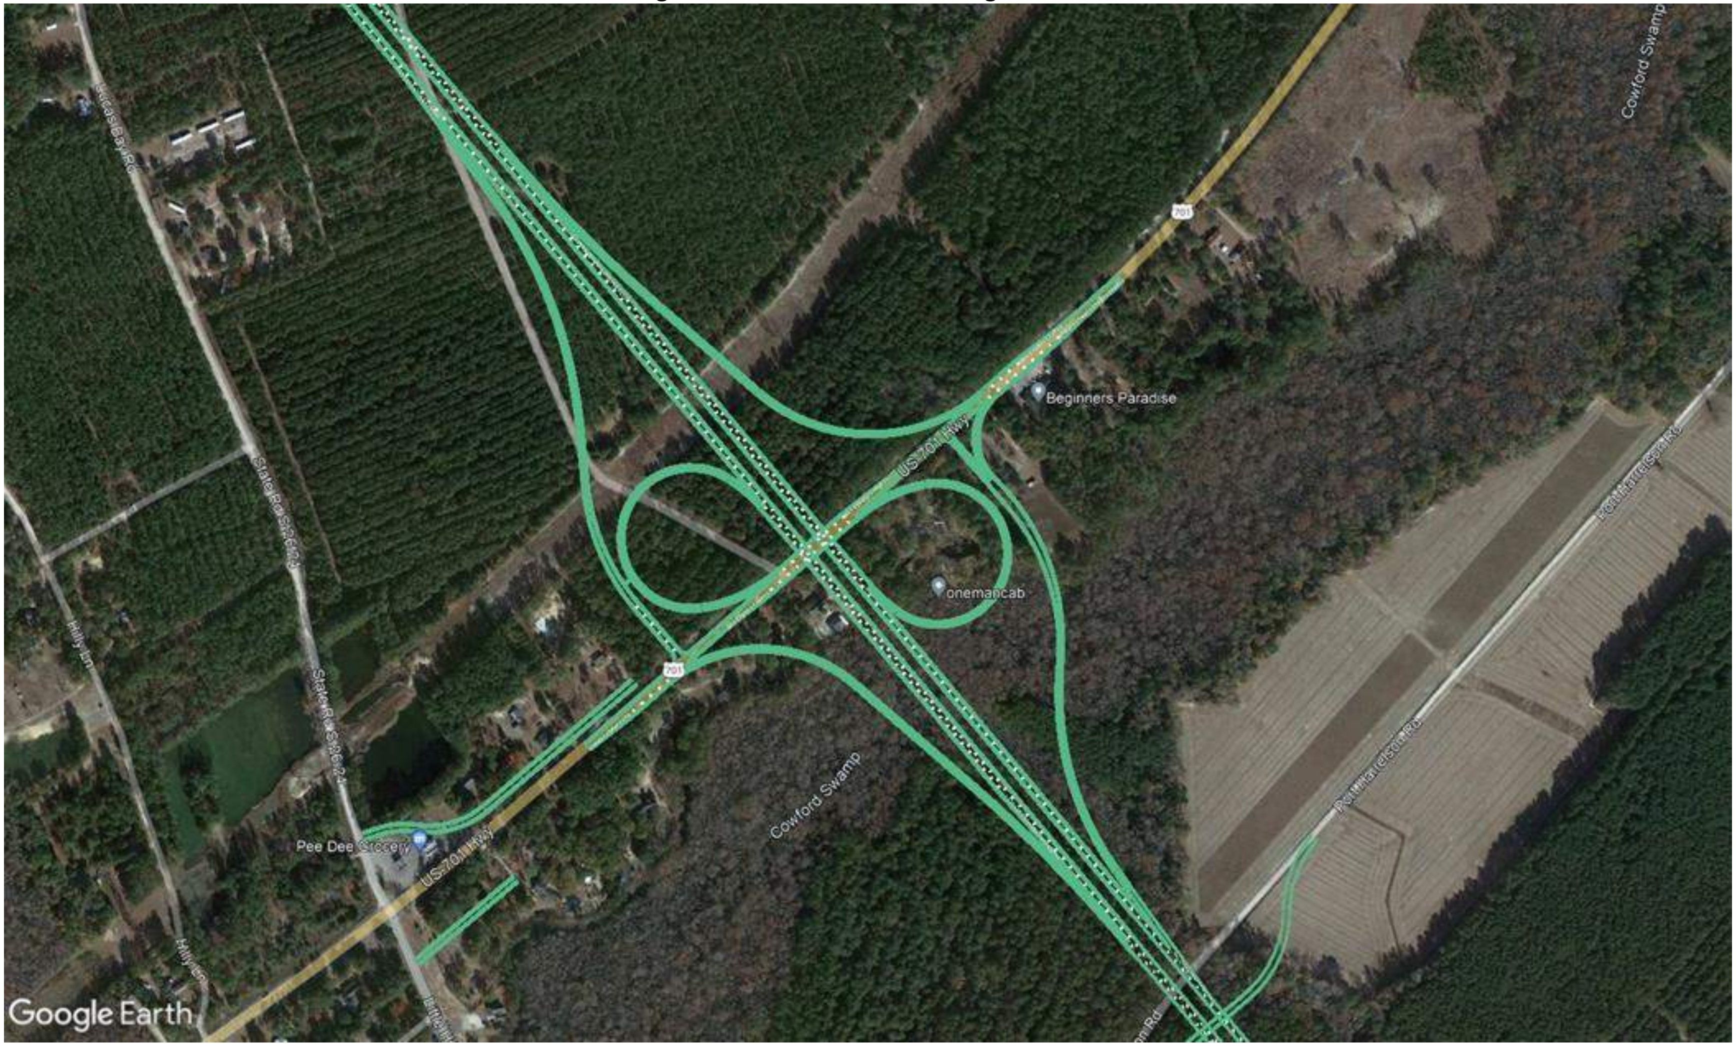
Northbound Off-Ramp Left	C	C	C	C	C	C	C	C	C	C	C	C

Figure 5.3 - US 701 ParClo Configuration 1



5.2.2 US 701 ParClo 2

The second proposed ParClo configuration on US 701 carries one lane in each direction on the US 701 approaches to the interchange. A separate free flow northbound right turn lane is provided on US 701 to the on-ramp to the eastbound SELL alignment while a separate northbound left turn lane and separate southbound right turn lane provides access to the westbound on-ramp. The loop off-ramp from westbound SELL provides an additional lane on southbound US 701 that drops to the loop on-ramp to eastbound SELL, creating a three-lane section across the bridge. All movements to the on-ramps are uncontrolled.

With the loop off-ramp in the northwest interchange quadrant handling movements from westbound SELL to southbound US 701, the westbound off-ramp right turn movement is handled on a directional ramp that creates a second northbound lane on US 701 that merges back into a single lane after approximately 700 feet. The eastbound off-ramp provides a single lane from its diverge point on the SELL alignment, widening to provide separate left and right turn lanes under stop sign control at US 701. The proposed US 701 ParClo 2 configuration is shown in **Figure 5.4**.

The results of the Synchro analysis for the only stop sign controlled approach at the interchange are shown in **Table 5.3** and contained in **Appendix H**. The Synchro analysis results show that the stop sign controlled eastbound off-ramp approach is expected to operate at LOS C or better. Reviews of the SimTraffic simulations indicated that traffic flowed relatively well without excessive queuing and with no vehicles denied entry into the network.

Table 5.3 - US 701 ParClo 2 Analysis Results

US 701 ParClo 2	ALT 07		ALT 08&09	
	AM	PM	AM	PM
Eastbound Off-Ramp	B	C	C	C

5.3 US 378 Interchange

The generic conceptual interchange configuration analyzed at US 378 is consistent for all new alignment alternatives (Alternatives 1 through 13). The US 378 interchange incorporates a loop off-ramp from northbound SELL to westbound US 378. No interchanges are present at US 378 in the improved arterial Alternatives 14, 15 and 16.

The US 378 interchange configuration carries one lane in each direction on the US 378 approaches to the interchange. Separate left turn lanes and free flow right turn lanes are provided to each on-ramp. All movements to the on-ramps are uncontrolled.

A loop off-ramp is provided for the northbound SELL alignment, which creates a second westbound through lane on US 378 past the southbound off-ramp intersection. This creates a three-lane cross-section on the bridge above

Figure 5.4 - US 701 ParClo Configuration 2

the SELL alignment. The other northbound off-ramps provides a free flow right turn lane to eastbound US 378, which merges into US 378 to the east. The southbound off-ramp provides a stop sign controlled shared left turn-right turn lane at its terminus with US 378. The proposed US 378 interchange configuration is shown in **Figure 5.5**.

The results of the Synchro analysis are shown in **Table 5.4** and contained in **Appendix I**. The Synchro analysis results show that the stop sign controlled off-ramp movement on the southbound off-ramp is expected to operate at LOS F during a number of time periods. Reviews of the SimTraffic simulations indicated that traffic was particularly congested on the southbound off-ramp in the afternoon peak hours for Alternatives 7, 8 and 9, when off-ramp queues were observed to extend back on the off-ramp towards the mainline. Additional test analyses incorporating separate left and right turn lanes did not improve the LOS. It may be necessary to provide a traffic signal at the southbound ramp terminus with US 378 to provide for improved traffic flow.

Table 5.4 - US 378 Interchange Analysis Results

US 378 Interchange	ALT 01		ALT 02		ALT 03&05		ALT 04&06		ALT 7		ALT 8&9		ALT 10&11		ALT 12&13	
	AM	PM	AM	PM	AM	PM	AM	PM	AM	PM	AM	PM	AM	PM	AM	PM
Southbound Off-Ramp	B	D	B	D	D	F	D	F	F	F	C	F	D	F	D	F

5.4 SC 544 Interchange

Alternative 14 includes a traffic signal controlled at-grade intersection of Segment O of Alternative 14 with SC 544. Included in the intersection concept is a flyover ramp from northbound SC 544 to westbound Segment O of Alternative 14. The DHV derived from the GSATS travel demand model assignments show volumes between 1,100 and 1,700 vehicles per hour for the northbound left turn from SC 544 to westbound Segment O. Due to this high volume of traffic, a two-lane flyover ramp is included in the conceptual interchange configuration.

The at-grade intersection also includes free-flow right turn lanes for eastbound traffic on Segment O and southbound traffic on SC 544. Dual eastbound left turn lanes are also provided. This configuration of the at-grade intersection is expected to operate at LOS D or better under the derived design hour volumes. The SC 544 interchange concept is shown in **Figure 5.6**.

5.5 US 501 Interchange

Alternative 15 includes a traffic signal controlled at-grade intersection of Segment M of Alternative 15 with US 501. Included in the intersection concept is a flyover ramp from westbound US 501 to southbound Segment M of Alternative 15. The DHV derived from the GSATS travel demand model assignments show volumes between 1,200 and 1,700 vehicles per hour for the westbound left turn from US 501 to southbound Segment M. Due to this high volume of traffic, a two-lane flyover ramp is included in the conceptual interchange configuration.

The at-grade intersection also includes free-flow right turn lanes for northbound traffic on Segment M and eastbound traffic on US 501. Dual northbound left turn lanes are also provided. This configuration of the at-grade intersection is expected to operate at LOS C or better under the derived design hour volumes. The US 501 interchange concept is shown in **Figure 5.7**.

Figure 5.5 - US 378 Interchange Configuration

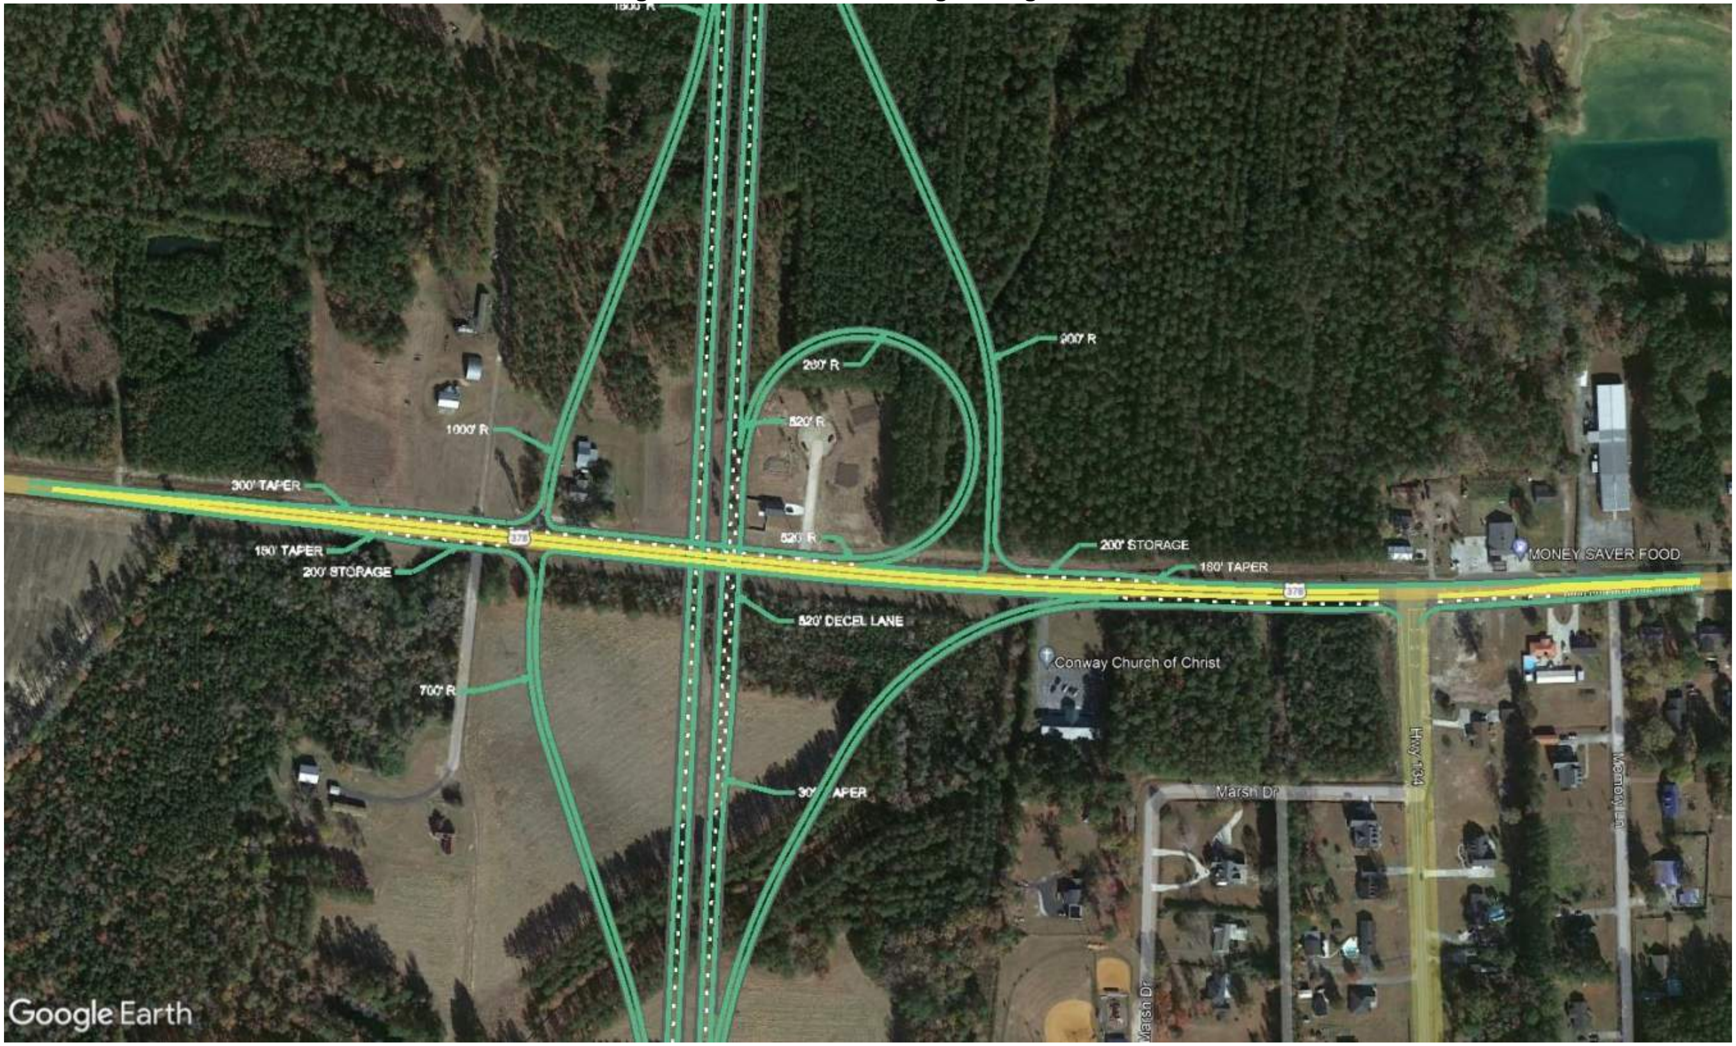


Figure 5.6 - SC 544 Interchange Configuration

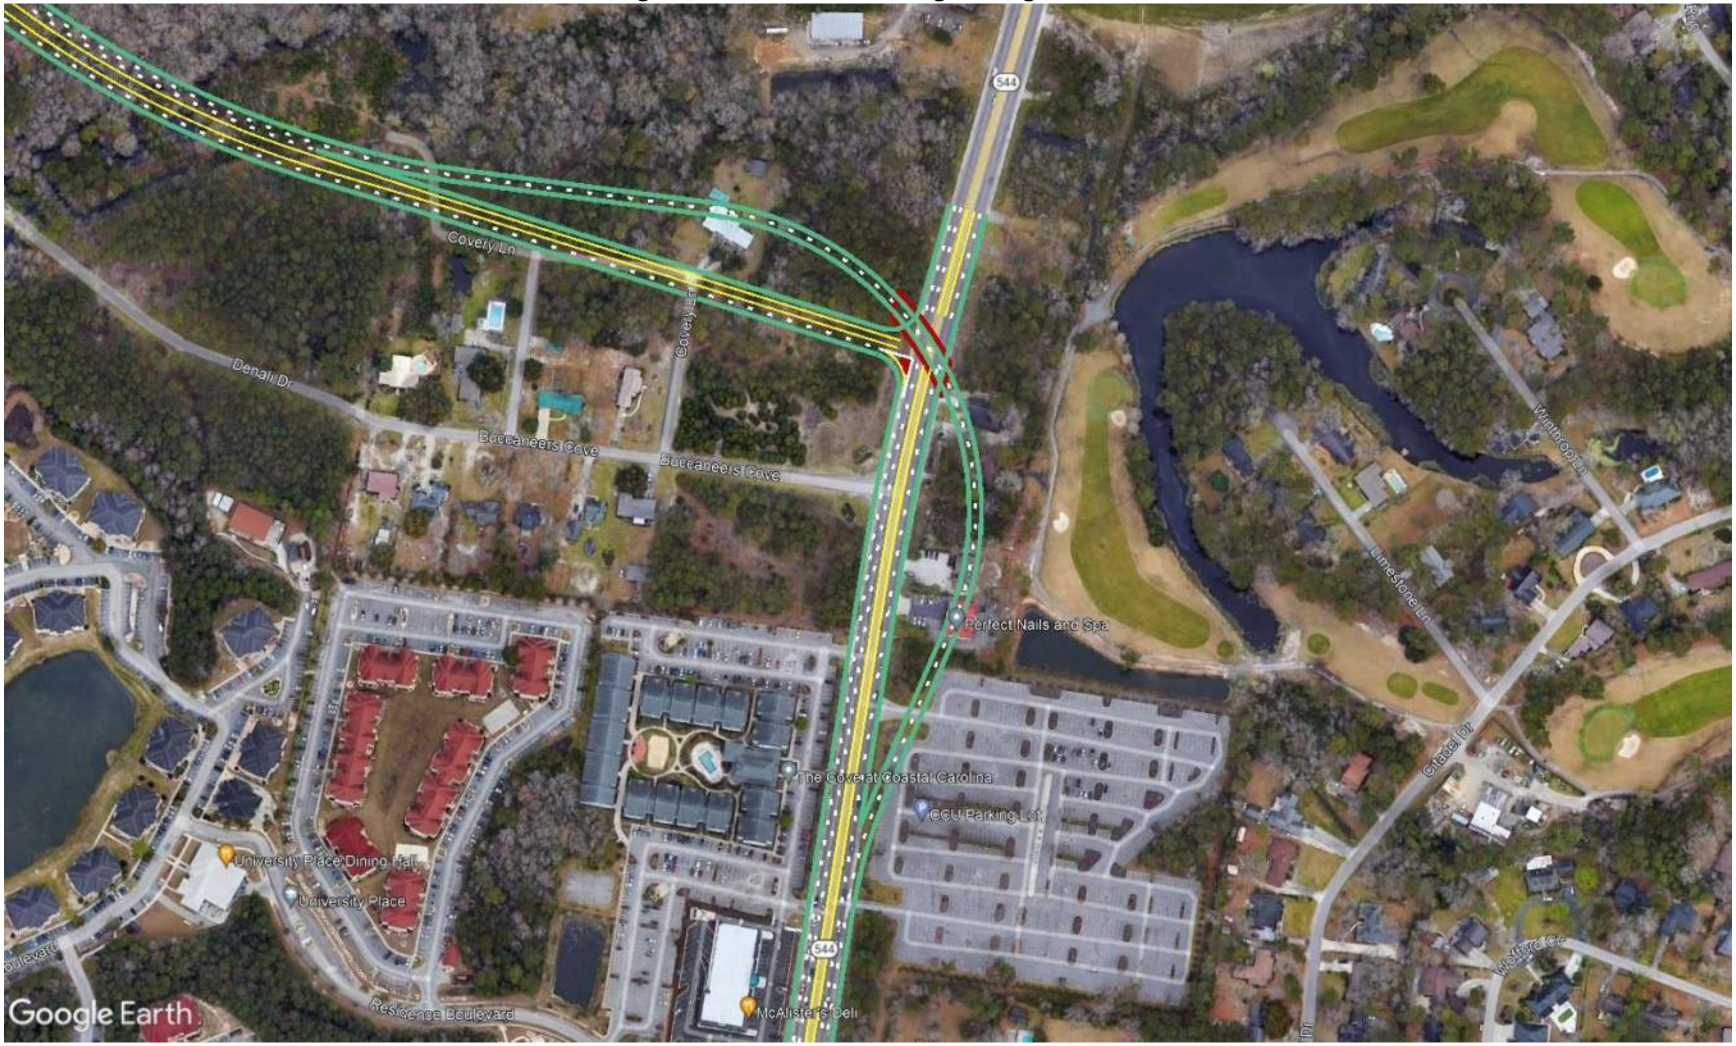

Figure 5.7 - US 501 Interchange Concept

5.6 US 501 – SC 544 Bypass Interchange

Alternatives 15 and 16 include a modification to the existing interchange between SC 544 Overpass and US 501. This modification includes providing a two-lane ramp from eastbound US 501 to southbound SC 544 Overpass to redirect traffic from making eastbound right turns and northbound right turns from SC 544. By rerouting the northbound left turn from SC 544 to the interchange, traffic signal operations at the US 501/SC 544 intersection should improve and serve more US 501 traffic by reducing the side street green time. Redirecting the eastbound right turn to a new free flow interchange ramp will also improve traffic flow through the signalized intersection. However, the high volume of derived design hour traffic traveling from northbound SC 544 Overpass to westbound US 501 through the existing interchange results in nearly continuous flow on the loop ramp in the northeast quadrant of the interchange.

The at-grade intersection of SC 544 with US 501 is modified to provide three westbound through lanes and four eastbound through lanes, with two of the eastbound lanes dropping to the proposed ramp to southbound SC 544 Overpass. The US 501 – SC 544 Bypass interchange concept is shown in **Figure 5.8**.

Figure 5.8 - US 501 - SC 544 Overpass Interchange Configuration

6 CONCLUSIONS AND RECOMMENDATIONS

Among the 16 alternatives developed for evaluation, Alternatives 1 through 13 are alternatives on new alignment running between the US 501/SC 22 interchange to termini on either US 17 or SC 31.

Three of the 16 alternatives (Alternatives 14, 15, and 16) consist primarily of improvements to existing roadways, including SC 544, US 501, and the Conway Perimeter Roadway. Alternatives 14 and 15 include two short sections of new alignment roadways connecting to SC 544 and US 501 respectively.

For the 13 new alignment alternatives (Alternatives 1 through 13), freeway segment, merge/diverge area, and weaving section analyses were performed using volumes derived from 2040 GSATS travel demand model volume forecasts, including turn movement forecast at proposed interchange locations.

Traffic volumes derived from the 2040 GSATS travel demand model were used in the analyses to assess the potential operation of the new alignment facilities, to assess the geometric configuration of the proposed interchanges, as well as to provide insight into the number of turn lanes that might be needed at ramp termini and at intersection locations. As refinement of the alternatives proceed, more accurate existing traffic data should be obtained where possible to corroborate the volumes used in these analyses.

Freeway segment analysis results do not show any issues with any of the new alignment alternatives (1 through 13). They are expected to operate at LOS C or better under AM and PM derived design hour volumes.

Merge area analysis results also do not show any issues with the anticipated operation of the new alignment alternatives (Alternatives 1 through 13). All merge areas operate at LOS C or better with the exception of the merge area from the northbound on-ramp from SC 544 under PM design hour traffic in Alternative7, which is expected to operate at LOS D.

Diverge analysis results do not show any issues with the anticipated operation of the new alignment alternatives (Alternatives 1 through 13). All diverge areas operate at LOS C or better under derived design hour traffic in the AM and PM peak hours.

Weaving analysis results show the weaving section along westbound SC 22/SELL between the proposed and existing loop ramps at the US 501 interchange operate at LOS B or better under derived volumes in the AM and PM design hours.

The analysis of the new alignment conceptual alternatives indicates there are no significant operational conditions to separate one alternative from others in the selection of a Preferred Alternative.

The proposed interchange configurations of the new alignment alternatives at SC 707, US 701, and US 378 were evaluated using turning movement forecasts derived from the 2040 GSATS travel demand model. The interchanges as proposed appear to function well in all alternatives. Stop sign traffic control was assumed where were required at ramp termini. These stop sign controlled approaches generally operated at LOS D or better with the exception of the southbound off-ramp at US 378 in multiple alternatives. It may be necessary to provide traffic signal control at this ramp intersection.

Analyses of the interchanges in the alternatives making extensive use of widening of existing roadways (Alternatives 14 – 16) were also performed to assist in the development of these concepts.

As further development and refinement of the alternative and interchange concepts proceeds, actual traffic data should be collected to corroborate the volumes and analyses described within this report to assist in preparing final design concepts appropriate for opening and design year traffic operations.

As further development and refinement of the alternative and interchange concepts proceeds, forecasts based on actual peak hour traffic volume data should be incorporated into microsimulation models of the network alternatives. Using collected traffic data and complex microsimulation tools, such as TransModeler, would result in a better evaluation of the interaction of designs and traffic congestion within the individual alternatives, provide the basis for a comparative assessment of performance differences between the alternatives, and support the identification of a preferred alternative.

Appendix B—HCS Freeway Results for 2040 Build Condition

Freeway Segments
Alternative 1
AM Peak Hour

HCS7 Basic Freeway Segment Text Report

BASIC FREEWAY SEGMENT ANALYSIS

File Name:	2040_01_AM_NB_A.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/8/2022
Analysis Year:	2040
Time Period Analyzed:	AM Peak
Project Description:	SELL Alt 01 NB (SC 707 to US 701)
Units:	United States Customary

LOS and Performance Measures

Flow Rate, vp	597	pc/h/ln
Adjusted Capacity, cadj	2400	pc/h/ln
Speed, S	70.0	mi/h
Density, D	8.5	pc/mi/ln
Level of Service, LOS	A	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	977	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	977	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	597	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	597	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	8.5	pc/mi/ln
Level of Service, LOS	A	

Service Volume Table

Target LOS	A	B	C	D	E
Max Service Flow Rate (MSF), pc/h/ln	770	1257	1737	2111	2400
Service Flow Rate (SF), veh/h	1400	2285	3158	3838	4363
Service Volume, veh/h	1260	2057	2843	3454	3927
One Direction DSV, 1000 veh/day	13	21	28	35	39

BASIC FREEWAY SEGMENT ANALYSIS

File Name:	2040_01_AM_NB_B.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/8/2022
Analysis Year:	2040
Time Period Analyzed:	AM Peak
Project Description:	SELL Alt 01 NB (US 701 to US 378)
Units:	United States Customary

LOS and Performance Measures

Flow Rate, vp	448	pc/h/ln
Adjusted Capacity, cadj	2400	pc/h/ln
Speed, S	70.0	mi/h
Density, D	6.4	pc/mi/ln
Level of Service, LOS	A	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	732	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	732	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	448	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	448	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	6.4	pc/mi/ln
Level of Service, LOS	A	

Service Volume Table

Target LOS	A	B	C	D	E
Max Service Flow Rate (MSF), pc/h/ln	770	1257	1737	2111	2400
Service Flow Rate (SF), veh/h	1400	2285	3158	3838	4363
Service Volume, veh/h	1260	2057	2843	3454	3927
One Direction DSV, 1000 veh/day	13	21	28	35	39
Bi-Direction DSV, 1000 veh/day	23	37	52	63	71

Adjusted Capacity, cadj	2400	pc/h/ln
Speed, S	70.0	mi/h
Density, D	16.5	pc/mi/ln
Level of Service, LOS	B	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	1886	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1886	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	1152	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	1152	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	16.5	pc/mi/ln
Level of Service, LOS	B	

Service Volume Table

Target LOS	A	B	C	D	E
Max Service Flow Rate (MSF), pc/h/ln	770	1257	1737	2111	2400

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1911	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	1168	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	1168	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	16.7	pc/mi/ln
Level of Service, LOS	B	

Service Volume Table

Target LOS	A	B	C	D	E
Max Service Flow Rate (MSF), pc/h/ln	770	1257	1737	2111	2400

Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/8/2022
Analysis Year:	2040
Time Period Analyzed:	AM Peak
Project Description:	SELL Alt 03 NB (SC 707 to US 701)
Units:	United States Customary

LOS and Performance Measures

Flow Rate, vp	564	pc/h/ln
Adjusted Capacity, cadj	2400	pc/h/ln
Speed, S	70.0	mi/h
Density, D	8.1	pc/mi/ln
Level of Service, LOS	A	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	924	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	924	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	564	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	564	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	8.1	pc/mi/ln
Level of Service, LOS	A

BASIC FREEWAY SEGMENT ANALYSIS

File Name:	2040_03_AM_SB_A.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/8/2022
Analysis Year:	2040
Time Period Analyzed:	AM Peak
Project Description:	SELL Alt 03 SB (US 701 to SC 707)
Units:	United States Customary

LOS and Performance Measures

Flow Rate, vp	550	pc/h/ln
Adjusted Capacity, cadj	2400	pc/h/ln
Speed, S	70.0	mi/h
Density, D	7.9	pc/mi/ln
Level of Service, LOS	A	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	899	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	899	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	550	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	550	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	7.9	pc/mi/ln
Level of Service, LOS	A	

Service Volume Table

Target LOS	A	B	C	D	E
Max Service Flow Rate (MSF), pc/h/ln	770	1257	1737	2111	2400

BASIC FREEWAY SEGMENT ANALYSIS

File Name:	2040_03_PM_SB_B.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/8/2022
Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 03 SB (US 378 to US 701)
Units:	United States Customary

LOS and Performance Measures

Flow Rate, vp	1096	pc/h/ln
Adjusted Capacity, cadj	2400	pc/h/ln
Speed, S	70.0	mi/h
Density, D	15.7	pc/mi/ln
Level of Service, LOS	B	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	1794	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1794	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%

BASIC FREEWAY SEGMENT ANALYSIS

File Name:	2040_04_PM_NB_A.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/8/2022
Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 04 NB (US 17 to SC 707)
Units:	United States Customary

LOS and Performance Measures

Flow Rate, vp	932	pc/h/ln
Adjusted Capacity, cadj	2400	pc/h/ln
Speed, S	70.0	mi/h
Density, D	13.3	pc/mi/ln
Level of Service, LOS	B	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	1525	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1525	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	932	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	932	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	13.3	pc/mi/ln
Level of Service, LOS	B	

Service Volume Table

Target LOS	A	B	C	D	E
Max Service Flow Rate (MSF), pc/h/ln	770	1257	1737	2111	2400

Level of Service, LOS	B	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	1569	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1569	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	959	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	959	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	13.7	pc/mi/ln
Level of Service, LOS	B	

Service Volume Table

Target LOS	A	B	C	D	E
Max Service Flow Rate (MSF), pc/h/ln	770	1257	1737	2111	2400
Service Flow Rate (SF), veh/h	1400	2285	3158	3838	4363
Service Volume, veh/h	1260	2057	2843	3454	3927
One Direction DSV, 1000 veh/day	13	21	28	35	39
Bi-Direction DSV, 1000 veh/day	23	37	52	63	71

Work Zone Analysis

Work Zone Type	Shoulder Closed	
Lateral Distance to Barrier, fLAT	12	ft
Barrier Type	Hard Barrier Separation	
Barrier Type Indicator, fBr	0	
Area Type	Urban Area	
Area Type Indicator, fAT	0	
Daylight or Night	Daylight	
Daylight or Night Indicator, fDN	0	
Work Zone Speed Limit, SLwz	55	mi/h
Open Lanes	1	ln
Open Ratios	0.00	
Lane Clousure Severity Index, LCSI	1.00	
Queue Discharge Rate, QDRwz	2400	pc/h/ln
Percent Drop Capacity, awz	13.0	%
Work Zone Capacity, cwz	2400	pc/h/ln
Work Zone Capacity Adj., CAFwz	1.000	
Total Ramp Density	0.00	ramps/mi
Free-Flow Speed	70.0	mi/h
Work Zone FFS, FFSwz	75.0	mi/h
Work Zone FFS Adj., SAFwz	1.000

BASIC FREEWAY SEGMENT ANALYSIS

File Name:	2040_04_PM_SB_C.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/8/2022
Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 04 SB (US 378 to US 701)
Units:	United States Customary

LOS and Performance Measures

Flow Rate, vp	1091	pc/h/ln
Adjusted Capacity, cadj	2400	pc/h/ln
Speed, S	70.0	mi/h
Density, D	15.6	pc/mi/ln
Level of Service, LOS	B	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	1785	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1785	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi

Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1748	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	1068	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	1068	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	15.3	pc/mi/ln
Level of Service, LOS	B	

Service Volume Table

Target LOS	A	B	C	D	E
Max Service Flow Rate (MSF), pc/h/ln	770	1257	1737	2111	2400
Service Flow Rate (SF), veh/h	1400	2285	3158	3838	4363
Service Volume, veh/h	1260	2057	2843	3454	3927
One Direction DSV, 1000 veh/day	13	21	28	35	39

BASIC FREEWAY SEGMENT ANALYSIS

File Name:	2040_ALT7_AM_SB_B.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/8/2022
Analysis Year:	2040
Time Period Analyzed:	AM Peak
Project Description:	SELL Alt 07 SB (US 701 to SC 544)
Units:	United States Customary

LOS and Performance Measures

Flow Rate, vp	1060	pc/h/ln
Adjusted Capacity, cadj	2400	pc/h/ln
Speed, S	70.0	mi/h
Density, D	15.1	pc/mi/ln
Level of Service, LOS	B	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	1735	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1735	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	1060	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	1060	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	15.1	pc/mi/ln
Level of Service, LOS	B	

Service Volume Table

Target LOS	A	B	C	D	E

HCS7 Basic Freeway Segment Text Report

BASIC FREEWAY SEGMENT ANALYSIS

File Name:	2040_ALT8_PM_NB_B.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/8/2022
Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 08 NB (SC 544 to US 701)
Units:	United States Customary

LOS and Performance Measures

Flow Rate, vp	1481	pc/h/ln
Adjusted Capacity, cadj	2400	pc/h/ln
Speed, S	69.1	mi/h
Density, D	21.4	pc/mi/ln
Level of Service, LOS	C	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	2423	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	2423	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	1481	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	1481	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	69.1	mi/h
Density, D	21.4	pc/mi/ln
Level of Service, LOS	C	

Service Volume Table

Target LOS	A	B	C	D	E
Max Service Flow Rate (MSF), pc/h/ln	770	1257	1737	2111	2400
Service Flow Rate (SF), veh/h	1400	2285	3158	3838	4363

Level of Service, LOS	B	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	1813	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1813	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	1108	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	1108	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	15.8	pc/mi/ln
Level of Service, LOS	B	

Service Volume Table

Target LOS	A	B	C	D	E
Max Service Flow Rate (MSF), pc/h/ln	770	1257	1737	2111	2400
Service Flow Rate (SF), veh/h	1400	2285	3158	3838	4363
Service Volume, veh/h	1260	2057	2843	3454	3927
One Direction DSV, 1000 veh/day	13	21	28	35	39
Bi-Direction DSV, 1000 veh/day	23	37	52	63	71

Work Zone Analysis

Work Zone Type	Shoulder Closed	
Lateral Distance to Barrier, fLAT	12	ft
Barrier Type	Hard Barrier Separation	
Barrier Type Indicator, fBr	0	
Area Type	Urban Area	
Area Type Indicator, fAT	0	
Daylight or Night	Daylight	
Daylight or Night Indicator, fDN	0	
Work Zone Speed Limit, SLwz	55	mi/h
Open Lanes	1	ln
Open Ratios	0.00	
Lane Clousure Severity Index, LCSI	1.00	
Queue Discharge Rate, QDRwz	2400	pc/h/ln
Percent Drop Capacity, awz	13.0	%
Work Zone Capacity, cwz	2400	pc/h/ln
Work Zone Capacity Adj., CAFwz	1.000	
Total Ramp Density	0.00	ramps/mi
Free-Flow Speed	70.0	mi/h
Work Zone FFS, FFSwz	75.0	mi/h
Work Zone FFS Adj., SAFwz	1.000

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	535	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	327	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	327	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	4.7	pc/mi/ln
Level of Service, LOS	A	

Service Volume Table

Target LOS	A	B	C	D	E
Max Service Flow Rate (MSF), pc/h/ln	770	1257	1737	2111	2400

BASIC FREEWAY SEGMENT ANALYSIS

File Name:	2040_ALT10_PM_SB_A.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/8/2022
Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 10 SB (US 701 to SC 707)
Units:	United States Customary

LOS and Performance Measures

Flow Rate, vp	1144	pc/h/ln
Adjusted Capacity, cadj	2400	pc/h/ln
Speed, S	70.0	mi/h
Density, D	16.3	pc/mi/ln
Level of Service, LOS	B	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	1872	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1872	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	1144	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	1144	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	16.3	pc/mi/ln
Level of Service, LOS	B	

Service Volume Table

Target LOS	A	B	C	D	E

BASIC FREEWAY SEGMENT ANALYSIS

File Name:	2040_ALT12_AM_NB_E.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/8/2022
Analysis Year:	2040
Time Period Analyzed:	AM Peak
Project Description:	SELL Alt 12 NB (NB OFF-Ramp to US 501)
Units:	United States Customary

LOS and Performance Measures

Flow Rate, vp	77	pc/h/ln
Adjusted Capacity, cadj	2400	pc/h/ln
Speed, S	70.0	mi/h
Density, D	1.1	pc/mi/ln
Level of Service, LOS	A	

Step 1: Input Data

Number of Lanes, N	3	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	188	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	188	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	3	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	77	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	77	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	1.1	pc/mi/ln
Level of Service, LOS	A	

Service Volume Table

Target LOS	A	B	C	D	E
Max Service Flow Rate (MSF), pc/h/ln	770	1257	1737	2111	2400

BASIC FREEWAY SEGMENT ANALYSIS

File Name:	2040_ALT12_PM_NB_B.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/8/2022
Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 12 NB (SC 707 to US 701)
Units:	United States Customary

LOS and Performance Measures

Flow Rate, vp	1161	pc/h/ln
Adjusted Capacity, cadj	2400	pc/h/ln
Speed, S	70.0	mi/h
Density, D	16.6	pc/mi/ln
Level of Service, LOS	B	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	1900	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1900	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%

HCS7 Basic Freeway Segment Text Report

BASIC FREEWAY SEGMENT ANALYSIS

File Name:	2040_ALT12_PM_SB_C.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/8/2022
Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 12 SB (US 378 to US 701)
Units:	United States Customary

LOS and Performance Measures

Flow Rate, vp	1063	pc/h/ln
Adjusted Capacity, cadj	2400	pc/h/ln
Speed, S	70.0	mi/h
Density, D	15.2	pc/mi/ln
Level of Service, LOS	B	

Step 1: Input Data

Number of Lanes, N	2	ln
Lane Width	12	ft
Segment Length	-	ft
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Right-Side Lateral Clearance	10	ft
Total Ramp Density, TRD	0.00	ramps/mi
Demand Volume	1739	veh/h
Peak Hour Factor, PHF	0.90	
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%

Step 2: Estimate and Adjust FFS

Estimating FFS		
Measured or Base FFS	Base	
Base Free-Flow Speed, BFFS	70.0	mi/h
Lane Width	12	ft
Lane Width Adjustment, fLW	0.0	mi/h
Right-Side Lateral Clearance	10	ft
Right-Side Lateral Clearance Adj., fRLC	0.0	mi/h
Total Ramp Density, TRD	0.00	ramps/mi
TRD Adjustment	0.0	mi/h
Free-Flow Speed, FFS	70.0	mi/h
Speed Adjustments		
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h

Step 3: Estimate and Adjust Capacity

Adjusted Free-flow Speed, FFSadj	70.0	mi/h
Capacity, c	2400	pc/h/ln
Capacity Adjustments		
Driver Population	All Familiar	
Driver Population CAF	1.000	

Weather Type	Non-Severe Weather	
Weather Type CAF	1.000	
Incident Type	No Incident	
Incident Type CAF	1.000	
Final Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln

Step 4: Adjust Demand Volume

Demand Volume, V	1739	veh/h
Peak Hour Factor, PHF	0.90	
Number of Lanes, N	2	ln
Terrain Type	Level	
Percent Grade	-	%
Grade Length	-	mi
Percent Total Trucks	10.00	%
Percent Single-Unit Trucks, SUT	-	%
Percent Tractor-Trailers, TT	-	%
Proportion of Total Trucks, PT	0.1000	
Heavy Vehicle PCE, ET	2.000	
Heavy Vehicle Adjustment, fHV	0.909	
Demand Adjustment Factor, DAF	1.000	
Demand Flow Rate, vp	1063	pc/h/ln

Steps 5 and 6: Estimate Speed and Density and Determine LOS

Demand Flow Rate, vp	1063	pc/h/ln
Adjusted Free-Flow Speed, FFSadj	70.0	mi/h
Capacity Adjustment Factor, CAF	1.000	
Adjusted Capacity, cadj	2400	pc/h/ln
Breakpoint, BP	1200	pc/h/ln
Density at Capacity, Dc	45	pc/mi/ln
Mean Speed under Base Conditions, S	70.0	mi/h
Density, D	15.2	pc/mi/ln
Level of Service, LOS	B	

Service Volume Table

Target LOS	A	B	C	D	E
Max Service Flow Rate (MSF), pc/h/ln	770	1257	1737	2111	2400
Service Flow Rate (SF), veh/h	1400	2285	3158	3838	4363
Service Volume, veh/h	1260	2057	2843	3454	3927
One Direction DSV, 1000 veh/day	13	21	28	35	39
Bi-Direction DSV, 1000 veh/day	23	37	52	63	71

Work Zone Analysis

Work Zone Type	Shoulder Closed	
Lateral Distance to Barrier, fLAT	12	ft
Barrier Type	Hard Barrier Separation	
Barrier Type Indicator, fBr	0	
Area Type	Urban Area	
Area Type Indicator, fAT	0	
Daylight or Night	Daylight	
Daylight or Night Indicator, fDN	0	
Work Zone Speed Limit, SLwz	55	mi/h
Open Lanes	1	ln
Open Ratios	0.00	
Lane Clousure Severity Index, LCSI	1.00	
Queue Discharge Rate, QDRwz	2400	pc/h/ln
Percent Drop Capacity, awz	13.0	%
Work Zone Capacity, cwz	2400	pc/h/ln
Work Zone Capacity Adj., CAFwz	1.000	
Total Ramp Density	0.00	ramps/mi
Free-Flow Speed	70.0	mi/h
Work Zone FFS, FFSwz	75.0	mi/h
Work Zone FFS Adj., SAFwz	1.000

HCS7 Freeway Merge Text Report

FREEWAY MERGE ANALYSIS

File Name:	2040_ALT1_AM_NB_SC 707_ON.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/9/2022
Analysis Year:	2040
Time Period Analyzed:	AM Peak
Project Description:	SELL Alt 01 NB SC 707 On-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in On-Ramp (Merge) Influence Area, DR	8.6	pc/mi/ln
Level of Service, LOS	A	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	63.3	mi/h
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp (Merge) Junction, S	63.3	mi/h
Density Across All Lanes, D	12.3	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data		
Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	976	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data		
Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Acceleration Lane, LA or LA1	1435	ft
Length of Second Acceleration Lane, LA2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	976	302	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	1193	369	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps		
Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	1193	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	1562	4800	No
vR	369	2000	No
vR12	1562	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	369	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1193	pc/h
Length of Acceleration Lane, LA	1435	ft
Density in On-Ramp Influence Area, DR	8.6	pc/mi/ln
Density in On-Ramp Influence Area, DR	7.8	veh/mi/ln
Level of Service, LOS	A	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1435	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	1193	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1193	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	1562	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.239	
Average Speed in Ramp Influence Area, SR	63.3	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	63.3	mi/h
Density Across All Lanes, D	12.3	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	661	1162	1560	1833	-
Service Flow Rate (SF), veh/h	1202	2112	2836	3332	-
Service Volume, veh/h	1081	1901	2552	2999	-
One Direction DSV, 1000 veh/day	11	19	26	30	-
Bi-Direction DSV, 1000 veh/day	20	35	46	55	-
Ramp					
Max Service Flow Rate (MSF), pc/h/ln	409	719	965	1134	-
Service Flow Rate (SF), veh/h	372	654	877	1031	-
Service Volume, veh/h	335	588	790	928	-
One Direction DSV, 1000 veh/day	3	6	8	9	-

Design Analysis Table

Number of Lanes, ln	2	2	3	3	4	4	5	5

Number of Ramp Lanes, ln	1	2	1	2	1	2	1	2
Density, pc/mi/ln	12.3	12.3	8.0	7.9	6.0	5.9	4.8	4.7

Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	318	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	864	pc/h
Length of Acceleration Lane, LA	1500	ft
Density in On-Ramp Influence Area, DR	5.2	pc/mi/ln
Density in On-Ramp Influence Area, DR	4.7	veh/mi/ln
Level of Service, LOS	A	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1500	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	864	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	864	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	1182	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.229	
Average Speed in Ramp Influence Area, SR	63.6	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	63.6	mi/h
Density Across All Lanes, D	9.3	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	654	1134	1516	1755	-
Service Flow Rate (SF), veh/h	1189	2061	2756	3190	-

Project Description:	SELL Alt 01 SB US 378 On-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in On-Ramp (Merge) Influence Area, DR	7.1	pc/mi/ln
Level of Service, LOS	A	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	62.9	mi/h
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp (Merge) Junction, S	62.9	mi/h
Density Across All Lanes, D	8.9	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data

Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	694	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data

Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Acceleration Lane, LA or LA1	1120	ft
Length of Second Acceleration Lane, LA2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	694	220	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	848	269	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps

Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	848	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	1117	4800	No
vR	269	2000	No
vR12	1117	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000

FREEWAY MERGE ANALYSIS

File Name:	2040_ALT1_PM_NB_SC 707_ON.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/9/2022
Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 01 NB SC 707 On-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in On-Ramp (Merge) Influence Area, DR	18.9	pc/mi/ln
Level of Service, LOS	B	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	61.8	mi/h
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp (Merge) Junction, S	61.8	mi/h
Density Across All Lanes, D	23.5	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data

Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	1887	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data

Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Acceleration Lane, LA or LA1	1435	ft
Length of Second Acceleration Lane, LA2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	1887	491	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	2307	600	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps

Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	2307	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	2907	4800	No
vR	600	2000	No
vR12	2907	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	600	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	2307	pc/h
Length of Acceleration Lane, LA	1435	ft
Density in On-Ramp Influence Area, DR	18.9	pc/mi/ln
Density in On-Ramp Influence Area, DR	17.2	veh/mi/ln
Level of Service, LOS	B	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1435	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	2307	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	2307	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	2907	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.292	
Average Speed in Ramp Influence Area, SR	61.8	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	61.8	mi/h
Density Across All Lanes, D	23.5	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	686	1205	1618	1904	-
Service Flow Rate (SF), veh/h	1247	2190	2942	3462	-

Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	1448	197	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps

Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	1448	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	1645	4800	No
vR	197	4000	No
vR12	1645	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	4000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	4000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	197	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1448	pc/h
Length of Acceleration Lane, LA	1500	ft
Density in On-Ramp Influence Area, DR	8.9	pc/mi/ln
Density in On-Ramp Influence Area, DR	8.1	veh/mi/ln
Level of Service, LOS	A	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1500	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	1448	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1448	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	1645	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.236	
Average Speed in Ramp Influence Area, SR	63.4	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	63.4	mi/h
Density Across All Lanes, D	13.0	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E

FREEWAY MERGE ANALYSIS

File Name:	2040_ALT2_AM_SB_US 701_LoopON.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/9/2022
Analysis Year:	2040
Time Period Analyzed:	AM Peak
Project Description:	SELL Alt 02 SB US 701 Loop On-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in On-Ramp (Merge) Influence Area, DR	4.7	pc/mi/ln
Level of Service, LOS	A	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	63.6	mi/h
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp (Merge) Junction, S	63.6	mi/h
Density Across All Lanes, D	8.8	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data		
Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	669	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data		
Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Acceleration Lane, LA or LA1	1500	ft
Length of Second Acceleration Lane, LA2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	669	246	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	818	301	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps		
Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	818	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	1119	4800	No
vR	301	2000	No
vR12	1119	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	301	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	818	pc/h
Length of Acceleration Lane, LA	1500	ft
Density in On-Ramp Influence Area, DR	4.7	pc/mi/ln
Density in On-Ramp Influence Area, DR	4.3	veh/mi/ln
Level of Service, LOS	A	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1500	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	818	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	818	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	1119	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.228	
Average Speed in Ramp Influence Area, SR	63.6	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	63.6	mi/h
Density Across All Lanes, D	8.8	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	654	1134	1516	1755	-

Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	1551	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data

Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Acceleration Lane, LA or LA1	800	ft
Length of Second Acceleration Lane, LA2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	1551	166	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	1896	203	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps

Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	1896	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	2099	4800	No
vR	203	2000	No
vR12	2099	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	203	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1896	pc/h
Length of Acceleration Lane, LA	800	ft
Density in On-Ramp Influence Area, DR	16.8	pc/mi/ln
Density in On-Ramp Influence Area, DR	15.3	veh/mi/ln
Level of Service, LOS	B	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	800	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	1896	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1896	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	2099	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.297	
Average Speed in Ramp Influence Area, SR	61.7	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	61.7	mi/h
Density Across All Lanes, D	17.0	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E

FREEWAY MERGE ANALYSIS

File Name:	2040_ALT3_AM_NB_US 501_ON.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/9/2022
Analysis Year:	2040
Time Period Analyzed:	AM Peak
Project Description:	SELL Alt 03 NB US 501 On-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in On-Ramp (Merge) Influence Area, DR	1.7	pc/mi/ln
Level of Service, LOS	A	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	63.7	mi/h
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp (Merge) Junction, S	63.7	mi/h
Density Across All Lanes, D	5.7	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data

Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	411	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data

Number of Ramp Lanes	2	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Acceleration Lane, LA or LA1	1025	ft
Length of Second Acceleration Lane, LA2	825	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	411	184	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	502	225	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps

Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	502	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	727	4800	No
vR	225	4000	No
vR12	727	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	4000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	4000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	225	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	502	pc/h
Length of Acceleration Lane, LA	1500	ft
Density in On-Ramp Influence Area, DR	1.7	pc/mi/ln
Density in On-Ramp Influence Area, DR	1.5	veh/mi/ln
Level of Service, LOS	A	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1500	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	502	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	502	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	727	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.224	
Average Speed in Ramp Influence Area, SR	63.7	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	63.7	mi/h
Density Across All Lanes, D	5.7	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway

Average Speed in Ramp Influence Area, SR	62.7	mi/h
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp (Merge) Junction, S	62.7	mi/h
Density Across All Lanes, D	11.2	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data

Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	899	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data

Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Acceleration Lane, LA or LA1	1115	ft
Length of Second Acceleration Lane, LA2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	899	246	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	1099	301	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps

Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	1099	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	1400	4800	No
vR	301	2000	No
vR12	1400	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	301	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1099	pc/h
Length of Acceleration Lane, LA	1115	ft
Density in On-Ramp Influence Area, DR	9.3	pc/mi/ln
Density in On-Ramp Influence Area, DR	8.5	veh/mi/ln
Level of Service, LOS	A	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1115	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	1099	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1099	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	1400	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.259	
Average Speed in Ramp Influence Area, SR	62.7	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	62.7	mi/h
Density Across All Lanes, D	11.2	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	577	1092	1500	1857	1884

Demand Flow Rate, v	2151	672	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps

Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	2151	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	2823	4800	No
vR	672	2000	No
vR12	2823	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	672	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	2151	pc/h
Length of Acceleration Lane, LA	1120	ft
Density in On-Ramp Influence Area, DR	20.2	pc/mi/ln
Density in On-Ramp Influence Area, DR	18.4	veh/mi/ln
Level of Service, LOS	C	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1120	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	2151	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	2151	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	2823	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.308	
Average Speed in Ramp Influence Area, SR	61.4	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	61.4	mi/h
Density Across All Lanes, D	23.0	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	562	1062	1459	1805	1829
Service Flow Rate (SF), veh/h	1021	1931	2653	3281	3324

Date:	6/9/2022
Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 04 NB US 501 On-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in On-Ramp (Merge) Influence Area, DR	8.9	pc/mi/ln
Level of Service, LOS	A	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	63.4	mi/h
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp (Merge) Junction, S	63.4	mi/h
Density Across All Lanes, D	13.0	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data

Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	1197	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data

Number of Ramp Lanes	2	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Acceleration Lane, LA or LA1	1025	ft
Length of Second Acceleration Lane, LA2	825	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	1197	153	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	1463	187	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps

Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	1463	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	1650	4800	No
vR	187	4000	No
vR12	1650	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	4000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	4000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	187	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1463	pc/h
Length of Acceleration Lane, LA	1500	ft
Density in On-Ramp Influence Area, DR	8.9	pc/mi/ln
Density in On-Ramp Influence Area, DR	8.1	veh/mi/ln
Level of Service, LOS	A	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1500	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	1463	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1463	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	1650	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.236	
Average Speed in Ramp Influence Area, SR	63.4	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	63.4	mi/h
Density Across All Lanes, D	13.0	pc/mi/ln

FREEWAY MERGE ANALYSIS

File Name:	2040_ALT4_PM_SB_US 701_ON.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/9/2022
Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 04 SB US 701 On-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in On-Ramp (Merge) Influence Area, DR	19.1	pc/mi/ln
Level of Service, LOS	B	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	61.7	mi/h
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp (Merge) Junction, S	61.7	mi/h
Density Across All Lanes, D	21.5	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data			
Number of Freeway Lanes	2		ln
Freeway Free-Flow Speed, FFS	70.0		mi/h
Segment Length	1500		ft
Multilane Highway or C-D Roadway?	Freeway		
Demand Volume, V	1958		veh/h
Peak Hour Factor, PHF	0.90		
Ramp Data			
Number of Ramp Lanes	1		ln
Ramp Free-Flow Speed, SFR	35.0		mi/h
Ramp Side	Right		
Length of First Acceleration Lane, LA or LA1	1115		ft
Length of Second Acceleration Lane, LA2	-		ft
Junction Components	Freeway	Ramp	
Demand Volume, V	1958	211	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	2393	258	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps		
Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	2393	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	2651	4800	No
vR	258	2000	No
vR12	2651	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	258	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	2393	pc/h
Length of Acceleration Lane, LA	1115	ft
Density in On-Ramp Influence Area, DR	19.1	pc/mi/ln
Density in On-Ramp Influence Area, DR	17.4	veh/mi/ln
Level of Service, LOS	B	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1115	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	2393	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	2393	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	2651	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.298	
Average Speed in Ramp Influence Area, SR	61.7	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	61.7	mi/h
Density Across All Lanes, D	21.5	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E

Average Speed in Ramp Influence Area, SR	63.0	mi/h
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp (Merge) Junction, S	63.0	mi/h
Density Across All Lanes, D	10.0	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data

Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	802	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data

Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Acceleration Lane, LA or LA1	1210	ft
Length of Second Acceleration Lane, LA2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	802	231	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	980	282	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps

Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	980	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	1262	4800	No
vR	282	2000	No
vR12	1262	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	282	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	980	pc/h
Length of Acceleration Lane, LA	1210	ft
Density in On-Ramp Influence Area, DR	7.7	pc/mi/ln
Density in On-Ramp Influence Area, DR	7.0	veh/mi/ln
Level of Service, LOS	A	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1210	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	980	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	980	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	1262	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.250	
Average Speed in Ramp Influence Area, SR	63.0	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	63.0	mi/h
Density Across All Lanes, D	10.0	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway

Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	1518	396	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps		
Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	1518	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	1914	4800	No
vR	396	2000	No
vR12	1914	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	396	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1518	pc/h
Length of Acceleration Lane, LA	1500	ft
Density in On-Ramp Influence Area, DR	10.9	pc/mi/ln
Density in On-Ramp Influence Area, DR	9.9	veh/mi/ln
Level of Service, LOS	B	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1500	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	1518	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1518	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	1914	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.242	
Average Speed in Ramp Influence Area, SR	63.2	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	63.2	mi/h
Density Across All Lanes, D	15.1	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	707	1226	1638	1903	-
Service Flow Rate (SF), veh/h	1286	2228	2978	3460	-

FREEWAY MERGE ANALYSIS

File Name:	2040_ALT8_AM_NB_US 701_ON.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/9/2022
Analysis Year:	2040
Time Period Analyzed:	AM Peak
Project Description:	SELL Alt 08 NB US 701 On-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in On-Ramp (Merge) Influence Area, DR	10.8	pc/mi/ln
Level of Service, LOS	B	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	62.7	mi/h
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp (Merge) Junction, S	62.7	mi/h
Density Across All Lanes, D	12.7	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data

Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	1139	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data

Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Acceleration Lane, LA or LA1	1130	ft
Length of Second Acceleration Lane, LA2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	1139	167	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	1392	204	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps

Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	1392	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	1596	4800	No
vR	204	2000	No
vR12	1596	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar

FREEWAY MERGE ANALYSIS

File Name:	2040_ALT8_PM_SB_US 378_ON.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/9/2022
Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 08 SB US 378 On-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in On-Ramp (Merge) Influence Area, DR	21.4	pc/mi/ln
Level of Service, LOS	C	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	61.0	mi/h
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp (Merge) Junction, S	61.0	mi/h
Density Across All Lanes, D	25.6	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data

Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	1813	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data

Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Acceleration Lane, LA or LA1	1285	ft
Length of Second Acceleration Lane, LA2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	1813	744	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	2216	909	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps

Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	2216	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	3125	4800	No
vR	909	2000	No
vR12	3125	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	909	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	2216	pc/h
Length of Acceleration Lane, LA	1285	ft
Density in On-Ramp Influence Area, DR	21.4	pc/mi/ln
Density in On-Ramp Influence Area, DR	19.5	veh/mi/ln
Level of Service, LOS	C	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1285	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	2216	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	2216	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	3125	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.320	
Average Speed in Ramp Influence Area, SR	61.0	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	61.0	mi/h
Density Across All Lanes, D	25.6	pc/mi/ln

Design Analysis Table

Number of Lanes, ln	2	2	3	3	4	4	5	5
Number of Ramp Lanes, ln	1	2	1	2	1	2	1	2
Density, pc/mi/ln	25.6	25.4	16.3	16.1	12.0	11.9	9.6	9.5
LOS	C	C	B	B	B	A	B	A

Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 10 NB US 378 On-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in On-Ramp (Merge) Influence Area, DR	12.6	pc/mi/ln
Level of Service, LOS	B	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	62.7	mi/h
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp (Merge) Junction, S	62.7	mi/h
Density Across All Lanes, D	15.3	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data

Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	1421	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data

Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Acceleration Lane, LA or LA1	1245	ft
Length of Second Acceleration Lane, LA2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	1421	150	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	1737	183	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps

Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	1737	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	1920	4800	No
vR	183	2000	No
vR12	1920	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000

FREEWAY MERGE ANALYSIS

File Name:	2040_ALT12_PM_NB_SC 707_ON.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/9/2022
Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 12 NB SC 707 On-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in On-Ramp (Merge) Influence Area, DR	24.6	pc/mi/ln
Level of Service, LOS	C	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	59.7	mi/h
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp (Merge) Junction, S	59.7	mi/h
Density Across All Lanes, D	29.7	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data			
Number of Freeway Lanes	2		ln
Freeway Free-Flow Speed, FFS	70.0		mi/h
Segment Length	1500		ft
Multilane Highway or C-D Roadway?	Freeway		
Demand Volume, V	1900		veh/h
Peak Hour Factor, PHF	0.90		
Ramp Data			
Number of Ramp Lanes	1		ln
Ramp Free-Flow Speed, SFR	35.0		mi/h
Ramp Side	Right		
Length of First Acceleration Lane, LA or LA1	1285		ft
Length of Second Acceleration Lane, LA2	-		ft
Junction Components	Freeway	Ramp	
Demand Volume, V	1900	1005	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	2322	1228	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps		
Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	2322	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	3550	4800	No
vR	1228	2000	No
vR12	3550	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	1228	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	2322	pc/h
Length of Acceleration Lane, LA	1285	ft
Density in On-Ramp Influence Area, DR	24.6	pc/mi/ln
Density in On-Ramp Influence Area, DR	22.4	veh/mi/ln
Level of Service, LOS	C	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1285	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	2322	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	2322	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	3550	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.367	
Average Speed in Ramp Influence Area, SR	59.7	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	59.7	mi/h
Density Across All Lanes, D	29.7	pc/mi/ln

Design Analysis Table

Number of Lanes, ln	2	2	3	3	4	4	5	5
Number of Ramp Lanes, ln	1	2	1	2	1	2	1	2
Density, pc/mi/ln	29.7	29.5	18.6	18.5	13.7	13.6	11.0	10.9
LOS	C	C	B	B	B	B	B	B

Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	1434	231	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for On-Ramps		
Adjacent Upstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFM	1.000	
Flow Rate in Lanes 1 and 2, v12	1434	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vFO	1665	4800	No
vR	231	4000	No
vR12	1665	4600	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	4000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	4000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate on Ramp, vR	231	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1434	pc/h
Length of Acceleration Lane, LA	1500	ft
Density in On-Ramp Influence Area, DR	9.0	pc/mi/ln
Density in On-Ramp Influence Area, DR	8.2	veh/mi/ln
Level of Service, LOS	A	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Length of Acceleration Lane, LA	1500	ft
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	1434	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1434	pc/h
Total Demand Flow Entering On-Ramp Infl. Area, vR12	1665	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for On-Ramp, MS	0.237	
Average Speed in Ramp Influence Area, SR	63.4	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	70.0	mi/h
Average Speed for On-Ramp Junction, S	63.4	mi/h
Density Across All Lanes, D	13.1	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	763	1328	1772	2067	-
Service Flow Rate (SF), veh/h	1388	2415	3222	3758	-

FREEWAY DIVERGE ANALYSIS

File Name:	2040_ALT1_AM_NB_US 378_LoopOFF.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/11/2022
Analysis Year:	2040
Time Period Analyzed:	AM Peak
Project Description:	SELL Alt 01 NB US 378 Loop Off-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in Off-Ramp (Diverge) Influence Area, DR	3.4	pc/mi/ln
Level of Service, LOS	A	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	57.4	mi/h
Average Speed in Outer Lanes of Freeway, SO	76.8	mi/h
Average Speed for Off-Ramp (Diverge) Junction, S	57.4	mi/h
Density Across All Lanes, D	7.3	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data

Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	687	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data

Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Deceleration Lane, LD or LD1	900	ft
Length of Second Deceleration Lane, LD2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	687	192	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	840	235	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for Off-Ramps

Adjacent Upstream On-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFD	1.000	
Flow Rate in Lanes 1 and 2, v12	840	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vF	840	4800	No
vR	235	2000	No
v12	840	4400	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate in Lanes 1 and 2, v12	840	pc/h
Length of Deceleration Lane, LA	900	ft
Density in Off-Ramp Influence Area, DR	3.4	pc/mi/ln
Density in Off-Ramp Influence Area, DR	3.1	veh/mi/ln
Level of Service, LOS	A	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	840	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	840	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for Off-Ramp, DS	0.449	
Average Speed in Ramp Influence Area, SR	57.4	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	76.8	mi/h
Average Speed for Off-Ramp Junction, S	57.4	mi/h
Density Across All Lanes, D	7.3	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	798	1384	1850	2256	2400

FREEWAY DIVERGE ANALYSIS

File Name:	2040_ALT1_PM_SB_US 701_OFF.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/11/2022
Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 01 SB US 701 Off-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in Off-Ramp (Diverge) Influence Area, DR	21.3	pc/mi/ln
Level of Service, LOS	C	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	56.3	mi/h
Average Speed in Outer Lanes of Freeway, SO	76.8	mi/h
Average Speed for Off-Ramp (Diverge) Junction, S	56.3	mi/h
Density Across All Lanes, D	19.7	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data

Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	1817	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data

Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Deceleration Lane, LD or LD1	225	ft
Length of Second Deceleration Lane, LD2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	1817	570	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	2221	697	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for Off-Ramps

Adjacent Upstream On-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFD	1.000	
Flow Rate in Lanes 1 and 2, v12	2221	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vF	2221	4800	No
vR	697	2000	No
v12	2221	4400	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate in Lanes 1 and 2, v12	2221	pc/h
Length of Deceleration Lane, LA	225	ft
Density in Off-Ramp Influence Area, DR	21.3	pc/mi/ln
Density in Off-Ramp Influence Area, DR	19.4	veh/mi/ln
Level of Service, LOS	C	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	2221	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	2221	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for Off-Ramp, DS	0.491	
Average Speed in Ramp Influence Area, SR	56.3	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	76.8	mi/h
Average Speed for Off-Ramp Junction, S	56.3	mi/h
Density Across All Lanes, D	19.7	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	445	1030	1496	1903	2400

Ramp Data

Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Deceleration Lane, LD or LD1	835	ft
Length of Second Deceleration Lane, LD2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	728	47	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	890	57	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for Off-Ramps

Adjacent Upstream On-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFD	1.000	
Flow Rate in Lanes 1 and 2, v12	890	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vF	890	4800	No
vR	57	2000	No
v12	890	4400	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate in Lanes 1 and 2, v12	890	pc/h
Length of Deceleration Lane, LA	835	ft
Density in Off-Ramp Influence Area, DR	4.4	pc/mi/ln
Density in Off-Ramp Influence Area, DR	4.0	veh/mi/ln
Level of Service, LOS	A	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	890	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	890	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for Off-Ramp, DS	0.433	
Average Speed in Ramp Influence Area, SR	57.9	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	76.8	mi/h
Average Speed for Off-Ramp Junction, S	57.9	mi/h
Density Across All Lanes, D	7.7	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	767	1351	1814	2225	2400
Service Flow Rate (SF), veh/h	1394	2457	3298	4045	4363

Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/12/2022
Analysis Year:	2040
Time Period Analyzed:	AM Peak
Project Description:	SELL Alt 02 SB US 701 Off-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in Off-Ramp (Diverge) Influence Area, DR	9.6	pc/mi/ln
Level of Service, LOS	A	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	57.1	mi/h
Average Speed in Outer Lanes of Freeway, SO	76.8	mi/h
Average Speed for Off-Ramp (Diverge) Junction, S	57.1	mi/h
Density Across All Lanes, D	7.5	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data		
Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	702	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data		
Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Deceleration Lane, LD or LD1	225	ft
Length of Second Deceleration Lane, LD2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	702	279	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	858	341	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for Off-Ramps		
Adjacent Upstream On-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFD	1.000	
Flow Rate in Lanes 1 and 2, v12	858	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vF	858	4800	No
vR	341	2000	No
v12	858	4400	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h

FREEWAY DIVERGE ANALYSIS

File Name:	2040_ALT2_PM_NB_US 378_OFF.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/12/2022
Analysis Year:	2040
Time Period Analyzed:	PM Peak
Project Description:	SELL Alt 02 NB US 378 Off-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in Off-Ramp (Diverge) Influence Area, DR	15.4	pc/mi/ln
Level of Service, LOS	B	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	57.6	mi/h
Average Speed in Outer Lanes of Freeway, SO	76.8	mi/h
Average Speed for Off-Ramp (Diverge) Junction, S	57.6	mi/h
Density Across All Lanes, D	18.8	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data			
Number of Freeway Lanes	2		ln
Freeway Free-Flow Speed, FFS	70.0		mi/h
Segment Length	1500		ft
Multilane Highway or C-D Roadway?	Freeway		
Demand Volume, V	1776		veh/h
Peak Hour Factor, PHF	0.90		
Ramp Data			
Number of Ramp Lanes	1		ln
Ramp Free-Flow Speed, SFR	35.0		mi/h
Ramp Side	Right		
Length of First Deceleration Lane, LD or LD1	835		ft
Length of Second Deceleration Lane, LD2	-		ft
Junction Components	Freeway	Ramp	
Demand Volume, V	1776	149	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	2171	182	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for Off-Ramps		
Adjacent Upstream On-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFD	1.000	
Flow Rate in Lanes 1 and 2, v12	2171	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vF	2171	4800	No
vR	182	2000	No
v12	2171	4400	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate in Lanes 1 and 2, v12	2171	pc/h
Length of Deceleration Lane, LA	835	ft
Density in Off-Ramp Influence Area, DR	15.4	pc/mi/ln
Density in Off-Ramp Influence Area, DR	14.0	veh/mi/ln
Level of Service, LOS	B	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	2171	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	2171	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for Off-Ramp, DS	0.444	
Average Speed in Ramp Influence Area, SR	57.6	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	76.8	mi/h
Average Speed for Off-Ramp Junction, S	57.6	mi/h
Density Across All Lanes, D	18.8	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	769	1350	1817	2225	2400
Service Flow Rate (SF), veh/h	1398	2454	3303	4044	4363

FREEWAY DIVERGE ANALYSIS

File Name:	2040_03_AM_SB_US 378_OFF.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/13/2022
Analysis Year:	2040
Time Period Analyzed:	AM Peak
Project Description:	SELL Alt 03 SB US 378 Off-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in Off-Ramp (Diverge) Influence Area, DR	3.1	pc/mi/ln
Level of Service, LOS	A	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	57.6	mi/h
Average Speed in Outer Lanes of Freeway, SO	76.8	mi/h
Average Speed for Off-Ramp (Diverge) Junction, S	57.6	mi/h
Density Across All Lanes, D	6.4	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data			
Number of Freeway Lanes	2		ln
Freeway Free-Flow Speed, FFS	70.0		mi/h
Segment Length	1500		ft
Multilane Highway or C-D Roadway?	Freeway		
Demand Volume, V	605		veh/h
Peak Hour Factor, PHF	0.90		
Ramp Data			
Number of Ramp Lanes	1		ln
Ramp Free-Flow Speed, SFR	35.0		mi/h
Ramp Side	Right		
Length of First Deceleration Lane, LD or LD1	835		ft
Length of Second Deceleration Lane, LD2	-		ft
Junction Components	Freeway	Ramp	
Demand Volume, V	605	139	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	740	170	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for Off-Ramps		
Adjacent Upstream On-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFD	1.000	
Flow Rate in Lanes 1 and 2, v12	740	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vF	740	4800	No
vR	170	2000	No
v12	740	4400	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate in Lanes 1 and 2, v12	740	pc/h
Length of Deceleration Lane, LA	835	ft
Density in Off-Ramp Influence Area, DR	3.1	pc/mi/ln
Density in Off-Ramp Influence Area, DR	2.8	veh/mi/ln
Level of Service, LOS	A	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	740	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	740	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for Off-Ramp, DS	0.443	
Average Speed in Ramp Influence Area, SR	57.6	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	76.8	mi/h
Average Speed for Off-Ramp Junction, S	57.6	mi/h
Density Across All Lanes, D	6.4	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	764	1351	1815	2223	2400
Service Flow Rate (SF), veh/h	1389	2457	3299	4042	4363

HCS7 Freeway Diverge Text Report

FREEWAY DIVERGE ANALYSIS

File Name:	2040_ALT4_AM_NB_US 701_OFF.xuf
Analyst:	NM
Agency:	STV Incorporated
Jurisdiction:	Horry County
Date:	6/13/2022
Analysis Year:	2040
Time Period Analyzed:	AM Peak
Project Description:	SELL Alt 04 NB US 701 Off-Ramp
Units:	United States Customary

LOS and Performance Measures

Density in Off-Ramp (Diverge) Influence Area, DR	12.0	pc/mi/ln
Level of Service, LOS	B	
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Ramp Influence Area, SR	56.5	mi/h
Average Speed in Outer Lanes of Freeway, SO	76.8	mi/h
Average Speed for Off-Ramp (Diverge) Junction, S	56.5	mi/h
Density Across All Lanes, D	10.1	pc/mi/ln

Step 1: Specify Inputs and Convert Demand Volumes to Demand Flow Rates

Freeway Data

Number of Freeway Lanes	2	ln
Freeway Free-Flow Speed, FFS	70.0	mi/h
Segment Length	1500	ft
Multilane Highway or C-D Roadway?	Freeway	
Demand Volume, V	933	veh/h
Peak Hour Factor, PHF	0.90	

Ramp Data

Number of Ramp Lanes	1	ln
Ramp Free-Flow Speed, SFR	35.0	mi/h
Ramp Side	Right	
Length of First Deceleration Lane, LD or LD1	225	ft
Length of Second Deceleration Lane, LD2	-	ft

Junction Components	Freeway	Ramp	
Demand Volume, V	933	494	veh/h
Peak Hour Factor, PHF	0.90	0.90	
Percent Total Trucks	10.00	10.00	%
Percent SUTs	-	-	%
Percent TTs	-	-	%
Prop.Total Trucks, PT	0.1000	0.1000	
Heavy Vehicle PCE, ET	2.000	2.000	
Heavy Vehicle Adj., fHV	0.909	0.909	
Terrain Type	Level	Level	
Percent Grade	-	-	%
Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	1140	604	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for Off-Ramps

Adjacent Upstream On-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFD	1.000	
Flow Rate in Lanes 1 and 2, v12	1140	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vF	1140	4800	No
vR	604	2000	No
v12	1140	4400	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate in Lanes 1 and 2, v12	1140	pc/h
Length of Deceleration Lane, LA	225	ft
Density in Off-Ramp Influence Area, DR	12.0	pc/mi/ln
Density in Off-Ramp Influence Area, DR	10.9	veh/mi/ln
Level of Service, LOS	B	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	1140	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	1140	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for Off-Ramp, DS	0.482	
Average Speed in Ramp Influence Area, SR	56.5	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	76.8	mi/h
Average Speed for Off-Ramp Junction, S	56.5	mi/h
Density Across All Lanes, D	10.1	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	444	1031	1496	1889	-
Service Flow Rate (SF), veh/h	807	1875	2720	3434	-
Service Volume, veh/h	726	1687	2448	3090	-
One Direction DSV, 1000 veh/day	7	17	24	31	-
Bi-Direction DSV, 1000 veh/day	13	31	45	56	-
Ramp					
Max Service Flow Rate (MSF), pc/h/ln	470	1092	1584	2000	-
Service Flow Rate (SF), veh/h	427	993	1440	1818	-
Service Volume, veh/h	385	893	1296	1636	-
One Direction DSV, 1000 veh/day	4	9	13	16	-

Design Analysis Table

Number of Lanes, ln	2	2	3	3	4	4	5	5
Number of Ramp Lanes, ln	1	2	1	2	1	2	1	2
Density, pc/mi/ln	10.1	10.1	6.5	6.3	4.7	4.6	3.8	3.7
LOS	B	A	B	A	A	A	A	A

Grade Length	-	-	mi
Demand Adj.Factor, DAF	1.000	1.000	
Demand Flow Rate, v	908	94	pc/h

Step 2: Estimate the Approaching Flow Rate in Lanes 1 and 2

Estimating Flow in Lanes 1 and 2 for Off-Ramps

Adjacent Upstream On-Ramp Equilibrium Distance, LEQ	-	ft
Adjacent Downstream Off-Ramp Equilibrium Distance, LEQ	-	ft
Prop. Freeway Veh. in Lanes 1 and 2, PFD	1.000	
Flow Rate in Lanes 1 and 2, v12	908	pc/h

Step 3: Estimate Capacity of Ramp-Freeway Junction and Compare Flow Rates

Capacity Checks

	Actual	Maximum	Violation?
vF	908	4800	No
vR	94	2000	No
v12	908	4400	No

	Freeway	Ramp	
Unadjusted Capacity, cmd	4800	2000	pc/h
Driver Population	All Familiar	All Familiar	
Driver Population CAF	1.000	1.000	
Weather Type	Non-Severe Weather	Non-Severe Weather	
Weather Type CAF	1.000	1.000	
Incident Type	No Incident	-	
Final Capacity Adj. Factor, CAF	1.000	1.000	
Adjusted Capacity, cmda	4800	2000	pc/h

Step 4: Estimate Density in Ramp Influence Area and Determine LOS

Demand Flow Rate in Lanes 1 and 2, v12	908	pc/h
Length of Deceleration Lane, LA	815	ft
Density in Off-Ramp Influence Area, DR	4.7	pc/mi/ln
Density in Off-Ramp Influence Area, DR	4.3	veh/mi/ln
Level of Service, LOS	A	

Step 5: Estimate Speeds in the Vicinity of Ramp-Freeway Junctions

Freeway Free-Flow Speed, FFS	70.0	mi/h
Ramp Free-Flow Speed, SFR	35.0	mi/h
Driver Population	All Familiar	
Driver Population SAF	1.000	
Weather Type	Non-Severe Weather	
Weather Type SAF	1.000	
Final Speed Adjustment Factor, SAF	1.000	
Demand Flow Rate on Freeway, vF	908	pc/h
Demand Flow Rate in Lanes 1 and 2, v12	908	pc/h
Number of Outer Lanes on Freeway, NO	0	ln
Speed Index for Off-Ramp, DS	0.436	
Average Speed in Ramp Influence Area, SR	57.8	mi/h
Average Flow in Outer Lanes, vOA	-	pc/h/ln
Average Speed in Outer Lanes of Freeway, SO	76.8	mi/h
Average Speed for Off-Ramp Junction, S	57.8	mi/h
Density Across All Lanes, D	7.9	pc/mi/ln

Service Volume Table

Target LOS	A	B	C	D	E
Freeway					
Max Service Flow Rate (MSF), pc/h/ln	753	1344	1808	2215	2400
Service Flow Rate (SF), veh/h	1368	2443	3287	4027	4363
Service Volume, veh/h	1231	2199	2959	3625	3927
One Direction DSV, 1000 veh/day	12	22	30	36	39
Bi-Direction DSV, 1000 veh/day	22	40	54	66	71
Ramp					
Max Service Flow Rate (MSF), pc/h/ln	156	279	375	459	497
Service Flow Rate (SF), veh/h	142	253	341	417	452
Service Volume, veh/h	128	228	307	376	407
One Direction DSV, 1000 veh/day	1	2	3	4	4

Design Analysis Table
