Executive Summary

The South Carolina Department of Transportation (SCDOT) proposes to widen I-26 from just west of the existing interchange of I-26 and US 15 to just west of the I-26 and SC 27 interchange. The project is divided into two (2) segments: Segment 1 from near MM 172 to MM 179; and Segment 2 from MM 179 to near MM 187. The project includes the following elements: adding a travel lane in each direction of I-26, median / outside shoulder grading, barrier walls and/or cable guardrail installation, replacement of 11 bridges, including seven (7) overpass bridges and four (4) mainline bridges, addressing six (6) hydrological box culverts, two (2) "access" box culverts, improving the Exit 172 interchange and ramps, improving the Exit 177 interchange and ramps, and drainage improvements in Dorchester and Berkeley counties (refer to Figure 1). The Build Alternative is shown in Figures 2-1 through 2-29.

An Environmental Assessment is being prepared for this project. Per the Federal Highway Administration (FHWA) Title 23 CFR 772.5(2) and the SCDOT Traffic Noise Abatement Policy, the proposed project is a "Type I" project because it includes the addition of through-traffic lanes as well as horizontal alteration throughout the I-26 project corridor.

This Detailed Noise Analysis (DNA) documents the methodologies, results, and recommendations in compliance with FHWA Title 23 CFR 772 *Procedures for Abatement of Highway Traffic Noise and Construction Noise* and the SCDOT *Traffic Noise Abatement Policy* (2023). Per FHWA Title 23 CFR 772.5(2) and SCDOT Policy, the proposed project is a "Type I" project because it includes the addition of through-traffic lanes as well as horizontal alteration.

Traffic noise impacts and temporary construction noise impacts can be a consequence of transportation projects. This DNA utilized computer models created with the FHWA Traffic Noise Model® (TNM 2.5). The model was validated against field-collected traffic noise measurement data to determine existing conditions, predict future worst hour equivalent noise levels, and identify impacted receptors resulting from the proposed project.

Construction noise impacts may occur due to the proximity of noise-sensitive receptors to anticipated project construction activities. All reasonable efforts should be made to minimize exposure of noise-sensitive land uses to construction noise. Such efforts may include, but are not limited to, appropriate scheduling of construction activities, noise attenuating measures on construction equipment, and a consistent and open public involvement program.

For the Design Year 2055, traffic noise from the Build Alternative, which proposes widening I-26 into a multi lane facility from just west of the US 15 interchange at Exit 172 and ending just west of the SC 27 interchange at Exit 187, is predicted to impact sixty-seven (67) residential noise sensitive receptors (NAC B) near the project area.

In accordance with the SCDOT Noise Abatement Policy (2023), consideration for noise abatement measures was given to all impacted receptors. SCDOT Policy requires identification of whether it is "likely" or "unlikely" that noise barriers will be installed for each impacted noise sensitive area identified. The "Likely" identification of a noise barrier as a potential mitigation measure in this document is preliminary and does not represent a firm commitment by SCDOT to construct the

wall. The final decision on whether a noise barrier will be constructed will be made during the final design phase of the project. This decision will be based on a detailed noise analysis consistent with SCDOT and Federal Highway Administration (FHWA) criteria, including reasonableness and feasibility determinations, and feedback from affected property owners and residents. If a proposed barrier meets the necessary criteria and receives the required level of public support, it may be included in the final project design. Otherwise, it will not be constructed. **Nine (9) traffic noise abatement measures were assessed in this preliminary traffic noise analysis, nine (9) meet the SCDOT Policy feasibility criteria but not the reasonableness criteria, therefore all noise abatement measures are considered to be "unlikely" as part of this project.** Unless changes to the project occur that would result in either additional predicted traffic noise impacts or different feasibility and reasonableness conclusions for the evaluated traffic noise abatement measures, additional traffic noise analysis during final design is not recommended, and no noise abatement measures are proposed for incorporation into the project. This analysis completes the traffic noise requirements of the Title 23 CFR Part 772 and SCDOT Traffic Noise Policy.

I-26 Corridor Improvement MM 172-187
Dorchester and Berkeley Counties

1.0 INTRODUCTION & PROJECT BACKGROUND INFORMATION

The South Carolina Department of Transportation (SCDOT) proposes to widen I-26 from just west of the existing interchange of I-26 and US 15 to just west of the I-26 and SC 27 interchange. The project is divided into two (2) segments: Segment 1 from near MM 172 to MM 179; and Segment 2 from MM 179 to near MM 187. The project includes the following elements: adding a travel lane in each direction of I-26, median / outside shoulder grading, barrier walls and/or cable guardrail installation, replacement of 11 bridges, including seven (7) overpass bridges and four (4) mainline bridges, addressing six (6) hydrological box culverts, two (2) "access" box culverts, improving the Exit 172 interchange and ramps, improving the Exit 177 interchange and ramps, and drainage improvements in Dorchester and Berkeley counties (refer to Figure 1). The Build Alternative is shown in Figures 2-1 through 2-29.

This project is considered a Type I project due to the addition of traffic lanes and horizontal alterations. An Environmental Assessment is being prepared for this project. The Date of Public Knowledge will be the approval date of the EA.

The existing I-26 corridor consists of 2 travel lanes per direction with controlled access to the facility throughout the project corridor. Highway traffic noise is the dominant noise source within the project area and there are no other contributing noise sources (i.e. Rail, aviation etc.). Upon receiving the preliminary designs for the Build Alternative, the Noise Study Area (NSA) footprints were delineated to reflect appropriate design limits. Speeds vary within the corridor ranging from 45 miles per hour for local roads and 70 miles per hour on I-26.

The existing land use within the project area consists of single-family residential homes, which fall under Noise Abatement Criteria (NAC) Category B. At the time of this Detailed Noise Analysis (DNA), no planned or proposed building permits were identified. A total of 148 NAC B receptors were identified, all representing single-family residences.

For the purposes of this DNA, the project study area was divided into twenty-one (21) NSAs to group receptors influenced by similar noise sources. It should be noted that while there may be noise sensitive land uses toward the southern end of the project area, these locations were removed from the study because they will be evaluated in another project that overlaps these spatial limits. The general locations of the NSAs and Build Alternative are shown in Figures 2-1 through 2-29. There have been no previous noise studies conducted for the project area.

2.0 PROCEDURE

This DNA represents the analysis of the predicted traffic noise impacts and the identification of any "likely" noise abatement measures in the vicinity of the proposed I-26 corridor improvement project.

This analysis is consistent with Title 23 Code of Federal Regulations, Part 772, U.S. Department of Transportation, Federal Highway Administration (FHWA), *Procedures for Abatement of Highway Traffic Noise and Construction Noise*, and the SCDOT Traffic Noise Abatement Policy (2023).

The FHWA Traffic Noise Model® (TNM 2.5) was used to predict Base Year 2024, Design Year 2055 No-Build and Design Year 2055 Build condition hourly equivalent traffic noise levels, $L_{eq(h)}$, for noise-sensitive receptors near the proposed project (refer to Figures 2-1 through 2-29).

The noise analysis documented in this DNA was conducted in accordance with the following procedures:

- *Initial Project Scoping / Preparation:* Project preliminary express design plans were obtained; field maps were prepared; and project mapping, Geographic Information System (GIS) data, aerial photography, traffic data, and other available pertinent information were reviewed. In accordance with Traffic Noise Policy Section 3.2.2, a Noise Analysis Work Plan was approved on October 22nd, 2024, prior to initiation of any noise measurements or modeling.

- *Monitoring / Fieldwork:* Ambient sound level data was collected at 34 short-term noise measurement locations (20-minute durations) and two (2) long term measurement locations (approximately 15 hours) on March 11th – 12th, 2025 (refer to Noise Monitoring Data Forms in Appendix D and Figures 2-1 through 2-29). These measurements were taken in accordance with Section 5.1 of the SCDOT Noise Policy, and in consideration of the FHWA Reports FHWA-PD-96-046 "Measurement of Highway Related Noise," FHWA-HEP-18-065 "Noise Measurement Handbook," and FHWA-HEP-18-066 "Noise Measurement Field Guide." Traffic volume data, including vehicle classifications, was obtained during each measurement session by video recording in the field and counted using handheld traffic clickers. Traffic speeds during each measurement session were determined using a handheld radar speed device to calculate an overall average speed for each roadway and travel direction. Types of land use and property addresses were determined for all noise-sensitive receptors. Weather data was acquired using wunderground.com with location services turned on to access the closest weather monitoring station at each measurement location. Finally, a field measurement site sketch and event log were created for each noise measurement session.

- *Baseline (Validation) TNM model:* A TNM 2.5 model representing existing conditions was created utilizing receptors, roadways, terrain lines, ground zones, and barriers (to represent buildings). Classified traffic and speed data during each measurement session was applied

to validate the baseline TNM model at all ambient noise measurement locations for which traffic was the dominant source to within ±3 decibels (±3 dB(A)).

- *Traffic Noise Level Prediction:* Base Year (2024) Existing condition and Design Year (2055) No-build condition hourly traffic volumes and speeds that yielded the loudest hourly noise levels were added to the appropriate roadways in the validated baseline TNM model(s). Traffic volumes were divided into automobiles, medium trucks, heavy trucks, buses, and motorcycles based on the traffic data provided by the project team. Following receipt of the traffic data, the project's preliminary design was then incorporated into the validated TNM model(s), and Design Year (2055) Build condition hourly traffic volumes and speeds were added following the same procedure described for the Existing and No-Build conditions. TNM-predicted traffic noise levels at all noise sensitive receptors were then calculated and documented, including the screening of TNM-predicted traffic noise levels against ambient noise measurement data acquired in the field (see Appendix E).

- *Impact Assessment:* SCDOT NAC and Substantial Increase criteria were applied to assess predicted traffic noise NAC and Substantial Increase impacts at all noise sensitive receptors for the Design Year (2055) Build condition; impacts for the Build Alternative were documented (refer Appendix A) and locations where abatement had to be considered were identified.

- *Noise level contours*: Design Year Build traffic noise level contours where undeveloped lands were present can be found in Section 12.0.

- *Construction Noise:* Project-related construction noise was considered for potential effects to noise-sensitive receptors throughout the project corridor.

3.0 CHARACTERISTICS OF NOISE

Noise is defined as unwanted sound. It is emitted from many natural and man-made sources. Highway traffic noise is a composite of noises from engine exhaust, drive train, and tire-roadway interaction.

The magnitude of noise is usually described by a ratio of its sound pressure to a reference sound pressure, which is usually twenty micro-Pascals (20 μPa). Since the range of sound pressure ratios varies greatly – over many orders of magnitude, a base-10 logarithmic scale is used to express sound levels in dimensionless units of decibels (dB). The commonly accepted limits of detectable human hearing sound magnitudes are between the threshold of hearing at 0 dB and the threshold of pain at 140 dB.

Sound frequencies are reported in units of Hertz (Hz), which correspond to the number of vibrations per second of a given tone. A cumulative 'sound level' is equivalent to ten times the base-10 logarithm of the ratio of the sum of the sound pressures of all frequencies to the reference sound pressure. To simplify the mathematical process of determining sound levels, sound frequencies are grouped into ranges, or 'bands.' Sound levels are then calculated by adding the

cumulative sound pressure levels within each band – which are typically defined as one 'octave' or '1/3 octave' of the sound frequency spectrum.

The commonly accepted limitation of human hearing to detect sound frequencies is between 20 Hz and 20,000 Hz, and human hearing is most sensitive to the frequencies between 1,000 Hz – 6,000 Hz. Although people are generally not as sensitive to lower-frequency sounds as they are to higher frequencies, most people lose the ability to hear high-frequency sounds as they age. To accommodate varying receptor sensitivities, frequency sound levels are commonly adjusted, or 'filtered', before being logarithmically added and reported as a single 'sound level' magnitude of that filtering scale. The 'A-weighted' decibel (dB(A)) filtering scale applies numerical adjustments to sound frequencies to emphasize the frequencies at which human hearing is sensitive, and to minimize the frequencies to which human hearing is not as sensitive.

Common indoor and outdoor noise levels are presented in Table 1. As shown in the examples of noise levels, most individuals are exposed to fairly high noise levels from many sources on a regular basis.

The degree of disturbance or annoyance from exposure to unwanted sound – noise – depends upon three factors:

1. The amount, nature, and duration of the intruding noise

2. The relationship between the intruding noise and the existing (ambient) sound environment; and

3. The situation in which the disturbing noise is heard

In considering the first of these factors, it is important to note that individuals have varying sensitivity to noise. The time patterns and durations of noise also affect perception as to whether it is offensive. For example, noises that occur during nighttime (sleeping) hours are typically considered to be more disruptive than the same noises in the daytime.

Regarding the second factor, individuals often assess the annoyance of unwanted noise in terms of its relationship to noise from other sources (background noise). A car horn blowing at night when background noise levels are low would generally be more objectionable than one blowing in the afternoon when background noise levels are typically higher. The response to noise stimulus is analogous to the response to turning on an interior light. During the daytime, an illuminated bulb simply adds to the ambient light, but when eyes are conditioned to the dark of night, a suddenly illuminated bulb can be temporarily blinding.

Table 1: Common Indoor and Outdoor Noise Levels		
Common Outdoor Noise Levels	**Noise Level (dB(A))**	**Common Indoor Noise Levels**

	0	**Threshold of Hearing**

Adapted from Guide on Evaluation and Attenuation of Traffic Noise, American Association of State Highway and Transportation Officials (AASHTO). 1974 (revised 1993).

The third factor–situational noise–relates to how noise interferes with individual activities. In an environment with a noise level of 60 dB(A) (e.g., a large business office), normal conversation would be possible, while sleep might be difficult. Loud noises may easily interrupt activities that require a quiet setting; however, the same loud noises may have little effect on activities typically associated with higher ambient noise levels.

Over time, individuals may become accustomed to recurring intrusive noises in their environment. However, exposure to prolonged or excessively loud noises can prevent use of exterior and interior spaces and is believed to pose potential health risks. As a result, regulations exist for noise control and mitigation from particularly disruptive sources, such as airplanes, factories, railroads, and highways. For all "Type I" federal, state, or federal-aid highway projects in the State of South

Carolina, traffic and construction noise impact analysis and abatement assessment are conducted in accordance with the applicable SCDOT Policy.

4.0 NOISE ABATEMENT CRITERIA

4.1 Title 23 Code of Federal Regulations, Part 772 (23 CFR 772)

The FHWA has developed NACs and procedures to be used in the planning and design of highways. The purpose of 23 CFR 772 is, "To provide procedures for noise studies and noise abatement measures to help protect the public's health, welfare and livability, to supply noise abatement criteria, and to establish requirements for information to be given to local officials for use in the planning and design of highways approved pursuant to title 23 U.S.C."

The abatement criteria and procedures are set forth in 23 CFR 772, which also states, "In abating traffic noise impacts, a highway agency shall give primary consideration to exterior areas where frequent human use occurs."

A summary of the NAC for various land uses is presented in Table 2. The L_{eq}, or equivalent sound level, is the equivalent steady-state sound level which in a stated period contains the same acoustic energy as a time-varying sound level during the same period. Regarding traffic noise, fluctuating sound levels of traffic noise are represented in terms of L_{eq}, the steady, or 'equivalent', noise level with the same energy.

4.2 South Carolina Department of Transportation Traffic Noise Abatement Policy

The SCDOT Traffic Noise Abatement Policy (2023) establishes official policy on highway noise. This policy describes the SCDOT process that is used in determining traffic noise impacts, construction noise impacts and abatement measures and the equitable and cost-effective expenditure of public funds for traffic noise abatement. Where the FHWA has given highway agencies flexibility in implementing the 23 CFR 772 standards, this policy describes the SCDOT approach to implementation.

4.3 Noise Abatement Criteria

Table 2 lists the FHWA NAC land use activity categories and noise levels that, when approached, met, or exceeded under the project build condition, constitute a noise impact.

Table 2: Noise Abatement Criteria			
Hourly Equivalent A-Weighted Sound Level (decibels (dB(A))			
Activity Category	**Activity Criteria[1] $L_{eq(h)}$[2]**	**Evaluation Location**	**Activity Description**
A	57	Exterior	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B [3]	67	Exterior	Residential
C [3]	67	Exterior	Active sport areas, amphitheaters, auditoriums, campgrounds, cemeteries, daycare centers, hospitals, libraries, medical facilities, parks, picnic areas, places of worship, playgrounds, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, recreation areas, Section4(f) sites, schools, television studios, trails, and trail crossings
D	52	Interior	Auditoriums, day care centers, hospitals, libraries, medical facilities, places of worship, public meeting rooms, public or nonprofit institutional structures, radio studios, recording studios, schools, and television studios
E [3]	72	Exterior	Hotels, motels, offices, restaurants/bars, and other developed lands, properties or activities not included in A-D or F
F	--	--	Agriculture, airports, bus yards, emergency services, industrial, logging maintenance facilities, manufacturing, mining, rail yards, retail facilities, shipyards, utilities (water resources, water treatment, electrical), and warehousing
G	--	--	Undeveloped lands that are not permitted

[1] The $L_{eq(h)}$ Activity Criteria values are for impact determination only and are not design standards for noise abatement measures.

[2] The equivalent steady-state sound level which in a stated period of time contains the same acoustic energy as the time-varying sound level during the same time period, with $L_{eq(h)}$ being the hourly value of L_{eq}.

[3] Includes undeveloped lands permitted for this activity category.

5.0 AMBIENT NOISE LEVELS

Ambient noise refers to the background sound present in an environment, generated by both natural and human-made sources. This includes sounds such as wind, rain, thunder, birdsong, insects, household appliances, commercial activities, lawn mowers, airplanes, and vehicles. Essentially, it encompasses all sounds consistently present in a given area. Across the project corridor, ambient noise conditions are generally similar. During a field visit, analysts noted I-26 to be the dominant traffic noise source throughout the project corridor.

In addition to gathering information and making general observations about the project study area, ambient noise measurement and field work were conducted to collect simultaneous noise level readings and classify vehicle count data (see Table 3) to develop a comparison between noise levels measured in the field at locations where traffic noise is the dominant noise source, and the predicted hourly-equivalent traffic noise levels obtained from TNM. This exercise was performed to validate that the TNM 2.5 models predict noise levels within 3 dB(A) of the field observed noise levels produced by the traffic compositions at the time of collection. This process increases confidence in the model's ability to predict the future worst noise hour equivalent noise levels and assess potential traffic noise impacts accurately. Ambient noise measurements are also used to define ambient noise levels at locations where traffic noise is not the dominant source of noise.

Short-term ambient noise measurement data was collected in 10-second intervals over a 20-minute period for 34 sites throughout the project corridor. The ambient noise measurement locations are shown in Figures 2-1 through 2-29. The noise measurement results, concurrent traffic counts, observed vehicle speeds, weather information for the measurement sites and photographs of each location are included in Appendix D.

6.0 NOISE MODEL VALIDATION

TNM model validation is the process by which the accuracy of the existing conditions TNM 2.5 model is refined and confirmed by comparing noise levels at field measurement locations to the TNM-predicted noise levels at those same locations under the traffic conditions observed in the field at the time of the field measurements. The validation TNMs are then used as the basis upon which the TNMs for predicting existing year and design year noise levels are built. Since TNM 2.5 can only predict traffic noise levels, TNM models can only be validated for locations for which traffic was the dominant noise source. TNM model validation was performed for all short-term measurement locations for which traffic was the dominant noise source. A TNM model is considered validated if it is a reasonable representation of the existing noise study area and/or project area, and the TNM-predicted traffic noise levels are within ±3.0 dB(A) of the measured equivalent sound levels obtained at locations for which traffic was the dominant noise source.

Validation was achieved for all 34 noise measurement locations. The results of TNM model validation are included in Appendix D.

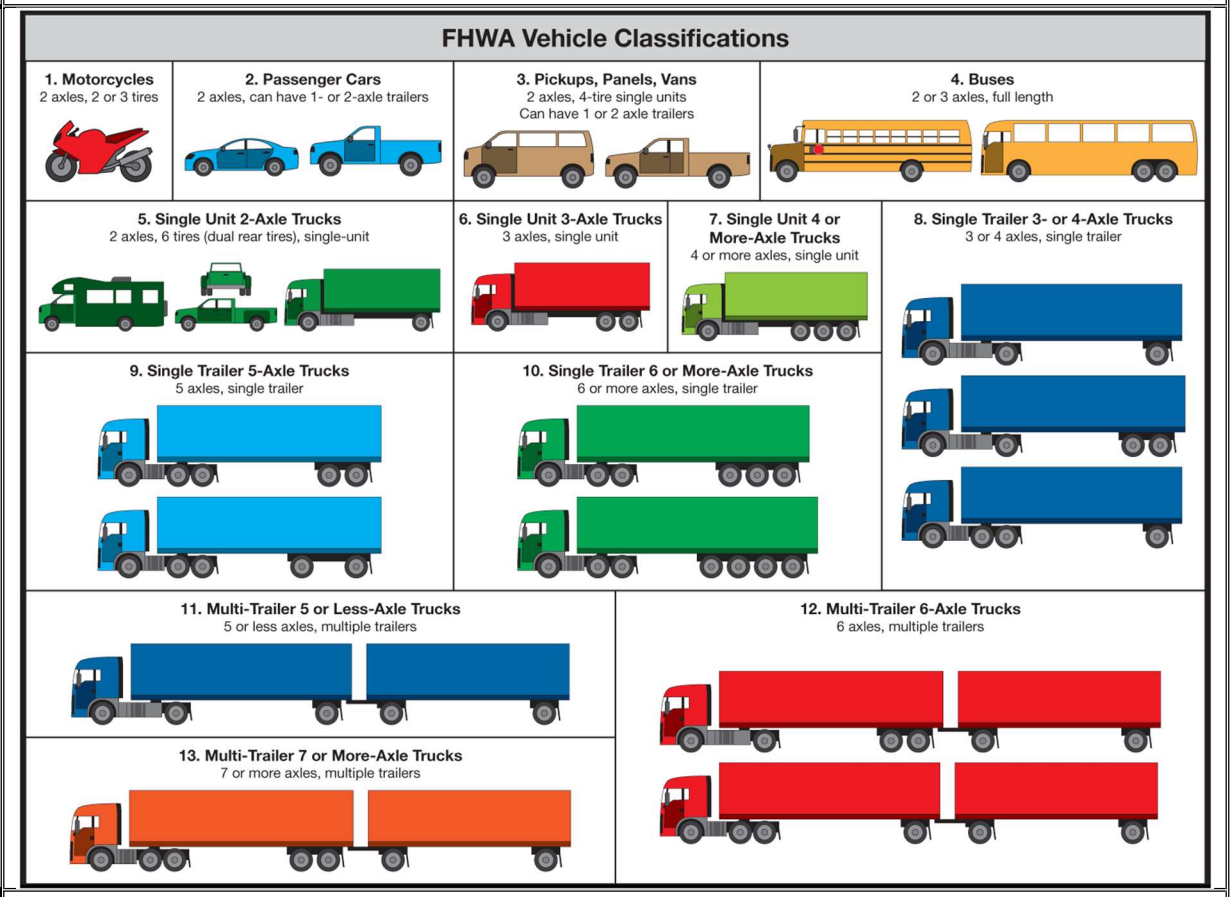
7.0 METHODOLOGY & ASSUMPTIONS FOR PREDICTING EXISTING NOISE

Traffic noise emission is composed of several variables, including the number, types, and travel speeds of the vehicles, as well as the geometry of the roadway(s) on which the vehicles travel. Additionally, variables such as weather and intervening topography affect the transmission of traffic noise from the vehicle(s) to noise sensitive receptors.

Traffic noise consists of three primary parts: tire/pavement noise, engine noise, and exhaust noise. Of these sources, tire/pavement noise is typically the most offensive at unimpeded travel speeds. Sporadic traffic noises such as horns, squealing brakes, screeching tires, etc. are considered aberrant and are not included within the predictive model algorithm. Traffic noise is not constant;

it varies in time depending upon the number, speed, type, and frequency of vehicles that pass by a given receptor. Furthermore, since traffic noise emissions are different for various types of vehicles, the TNM algorithm distinguishes between the source emissions from the following vehicle types depicted in Table 3: automobiles (FHWA vehicle classifications 2 and 3), medium trucks (FHWA vehicle classification 5), heavy trucks (FHWA vehicle classifications 6 – 13), buses (FHWA vehicle classification 4), and motorcycles (FHWA vehicle classification 1).

Table 3: Traffic Noise Model (TNM) Vehicle Classification Types



Source: https://www.fhwa.dot.gov/policyinformation/tmguide/tmg_2013/vehicle-types.cfm

In accordance with Federal Highway Administration requirements, detailed computer models were created using FHWA's TNM 2.5 software. The traffic noise prediction model TNM 2.5 uses the number and type of vehicles on the planned roadway, vehicle speeds, the physical characteristics of the road (curves, hills, depressions, elevations, etc.), receptor location and height, and, if applicable, barrier type, barrier ground elevation, and barrier segment top elevations. The computer models were validated to within acceptable tolerances of field- measured traffic noise data and were used to predict existing worst noise hour equivalent traffic noise levels for noise sensitive receptor locations identified in the vicinity of the I-26 Corridor Improvement project.

This analysis uses the traffic volumes that yield the loudest existing hourly noise levels for all roadway segments. Long-term ambient noise data was collected at two (2) locations as part of this project; however, substituting field measurements in lieu of TNM predicted noise levels were not discussed or approved by SCDOT. These long-term ambient noise field measurements were not used as replacement for modeled results during the impact analysis.

Interior hourly-equivalent noise levels are determined for NAC D land uses, such as hospitals, schools, medical facilities, and places of worship, by applying building noise reduction factors based on building type and window treatment that can be found in FHWA publication *Highway Traffic Noise: Analysis and Abatement Guidance*. Appropriate land uses are included in this analysis as NAC D receptors if:

a) These land uses have no exterior area(s) of frequent human use,

b) These land uses do have exterior area(s) of frequent human use, but they are located significantly further from the primary traffic noise source and/or shielded by building(s) such that there were no predicted impacts, OR

c) These land uses have exterior area(s) of frequent human use that are predicted to be impacted by traffic noise, but outdoor abatement options have been determined to not be feasible or not be reasonable.

It should be noted that zero (0) NAC D receptors were identified within the project corridor. No NAC D land uses were included as part of this analysis. Refer to Appendix A for predicted Base Year (2024) hourly equivalent traffic noise levels, as well as a comprehensive list of traffic noise receptors.

8.0 METHODOLOGY & ASSUMPTIONS FOR PREDICTING FUTURE NOISE

The TNM 2.5 models developed for the existing condition were updated with forecasted traffic volumes for the Design Year No-Build condition and used to predict future no-build worst noise hour equivalent traffic noise levels for the same noise sensitive receptor locations. This analysis uses the traffic volumes that yield the loudest future no-build hourly noise levels for the forecasted Design Year (2055) peak hour traffic volumes.

ATCS coordinated with the I-26 project team for all traffic related discussions prior to TNM modeling. Traffic compositions, vehicle mix percentages, and segmental breaks were all determined in collaboration with the project team.

Preliminary design information representing the Build Alternative were used for this DNA. The designs were incorporated into the TNM 2.5 models developed for the existing condition, along with appropriate forecasted traffic volumes for the Design Year Build condition, to predict future build condition worst noise hour equivalent traffic noise levels for all noise sensitive receptor locations identified in the vicinity of the I-26 corridor improvement project. This analysis uses the traffic volumes that yield the loudest future build condition hourly noise levels for the forecasted Design Year (2055) Build peak hour traffic volumes. Refer to Appendix A for predicted Design

Year (2055) No-Build and Design Year (2055) Build hourly equivalent traffic noise levels, as well as a comprehensive list of traffic noise receptors.

9.0 TRAFFIC NOISE IMPACTS

Traffic noise impacts occur when the predicted future build condition traffic noise levels either: [a] approach or exceed the FHWA NAC (with "approach" meaning within 1 dB(A) of the NAC values listed in Table 2), or [b] substantially exceed the existing noise levels in the design year by 15 dB(A) or greater.

Traffic noise is predicted to create sixty-seven (67) impacts in the Design Year (2055) Build condition. The number and types of predicted traffic noise impacts are shown in Table 4. Impacts are designated as either Design Year (2055) Build condition noise levels approaching or exceeding the FHWA NAC, Design Year (2055) Build condition noise levels causing a substantial increase over existing ambient noise levels, or by both criteria being met.

Table 4: Traffic Noise Impact Summary for Build Condition

DETAILED STUDY ALTERNATIVE	REASON FOR NOISE IMPACT	SUMMARY OF IMPACTED RECEPTORS[6] BY ACTIVITY CATEGORY[5]					
		A	B	C	D	E	ALL ACTIVITY CATEGORIES
Build Alternative 1	Based on NAC Criteria Only[1]	0	67	0	0	0	67
	Based on Substantial Increase Criteria Only[2]	0	0	0	0	0	0
	Based on Both Criteria[3]	0	0	0	0	0	0
	TOTAL DSA IMPACTS[4]	0	67	0	0	0	67

1: Predicted traffic noise level impacts due to design year worst hour Build-condition noise levels approaching or exceeding the FHWA NAC

2: Predicted design year worst hour noise levels exceeding existing worst hour noise levels by 15 dB(A) or greater. (SCDOT Substantial Increase Criteria).

3: Predicted traffic noise level impacts due to both 1 and 2 above.

4: Only one of the Note 1 or Note 2 conditions must be met for an impact to occur.

5: NACs F and G are not included because there are no impact criteria for non-noise sensitive land uses (NAC F) and undeveloped lands (NAC G). No analysis of noise impacts is required for these. Regarding NAC G, noise levels are provided to local officials to aid them in future land use planning efforts.

6: Values noted for Activity Category C, D, and E include Equivalent Receptor values for these non-residential land uses.

NSA 1

NSA 1 is located north of I-26 SB along White Lemon Road. Two (2) receptors were modeled in this NSA. Two (2) of those receptors consisted of residential land uses (NAC B), representing two (2) single family homes. Two (2) noise impacts (01-01 and 01-02) were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 2

NSA 2 is located south of I-26 NB along Dunnings Road. Three (3) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing three (3) single family homes. Three (3) noise impacts (02-01, 02-02, and 02-03) were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 3

NSA 3 is located south of I-26 northbound, between Tunnel Road, Seven Mile Road, and Spring Branch Road. Eleven (11) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing eleven (11) single family homes. One (1) noise impact (03-02) was predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 4

NSA 4 is located North of I-26 southbound along Seven Mile Road, west of Brown Town Road. Two (2) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing two (2) single family homes. One (1) noise impact (04-02) was predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 5

NSA 5 is located north of State Highway 453 southbound, along Shields Drive. Nine (9) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing nine (9) single family homes. Four (4) noise impacts (05-01, 05-02, 05-08, 05-09) were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 6

NSA 6 is located north of State Highway 453 southbound along Mockingbird Drive. Two (2) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing two (2) single family homes. One (1) noise impact (06-02) was predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 7

NSA 7 is located between Dogwood Trail and 1st Bend Road. Four (4) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing four (4) single family homes. No noise impacts were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 8

NSA 8 is located north of Jacob Drive, which is between 1st Bend Road and 2nd Bend Road, south of I-26 northbound. Two (2) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing two (2) single family homes. No noise impacts were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 9

NSA 9 is located north of I-26 southbound along Paradise Pond Lane, north of Greenhill Road. Two (2) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing two (2) single family homes. One (1) noise impact (09-01) was predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 10

NSA 10 is located south of I-26 northbound along Kal Road, Addison Road, and 2nd Bend Road. Twenty-one (21) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing twenty-one (21) single family homes. No noise impacts were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 11

NSA 11 is located south of I-26 northbound along Honeysuckle Road and 2nd Bend Road. Eight (8) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing eight (8) single family homes. Six (6) noise impacts (11-01, 11-04, 11-05, 11-06, 11-07, and 11-08) were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 12

NSA 12 is located north of I-26 southbound and is along Dantzler Pond Road and Emerald Lane. Four (4) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing four (4) single family homes. No noise impacts were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 13

NSA 13 is located north of I-26 southbound and is along 2nd Bend Road, between Greenhill Road and White Oak Lane. Twelve (12) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing twelve (12) single family homes. No noise impacts were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 14

NSA 14 is located north of I-26 southbound between Gelzer Lane and Two Churches Road. Fifteen (15) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing fifteen (15) single family homes. Fifteen (15) noise impacts (14-01, 14-02, 14-03, 14-04, 14-05, 14-06, 14-07, 14-08, 14-09, 14-10, 14-11, 14-12, 14-13, 14-14, 14-15) were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 15

NSA 15 is located south of I-26 northbound between Johnson Road and Family Circle, along Taylor Pond Road. Eleven (11) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing eleven (11) single family homes. No noise impacts were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 16

NSA 16 is located south of I-26 northbound, between Johnson Road and Family Circle. Eight (8) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing eight (8) single family homes. Six (6) noise impacts (16-01, 16-02, 16-03, 16-06, 16-07, 16-08) were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 17

NSA 17 is located north of I-26 southbound along Taylor Pond Road. Six (6) receptors were modeled in this NSA. Each of these receptors consisted of residential land uses (NAC B), representing six (6) single family homes. No noise impacts were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 18

NSA 18 is located north of I-26 northbound between Taylor Pond Road and Carrie Road. Fourteen (14) receptors were modeled in this NSA. Each of these receptors consisted of residential land use (NAC B), representing fourteen (14) single family homes. Thirteen (13) noise impacts (18-01, 18-02, 18-03, 18-04, 18-05, 18-06, 18-07, 18-08, 18-09, 18-10, 18-12, 18-13, 18-14) were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 19

NSA 19 is located south of I-26 northbound along Family Circle. Six (6) receptors were modeled in this NSA. Each of these receptors consisted of residential land use (NAC B), representing six (6) single family homes. Six (6) noise impacts (19-01, 19-02, 19-03, 19-04, 19-05, 19-06) were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 20

NSA 20 is located north of I-26 along Hillcrest Road, west of Beidler Forest Road. Five (5) receptors were modeled in this NSA. Each of these receptors consisted of residential land use (NAC B), representing five (5) single family homes. Three (3) noise impacts (20-01, 20-02, 20-05) were predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

NSA 21

NSA 21 is located south of I-26 northbound along Love Oak Road, between Beidler Forest Road and Wax Myrtle Lane. One (1) receptor was modeled in this NSA. This receptor is a residential land use receptor (NAC B) and represents one (1) single family home. One (1) noise impact (21-01) was predicted to approach or exceed the noise abatement criteria for the NAC B criteria under the design year 2055 build condition.

10.0 POTENTIAL TRAFFIC NOISE ABATEMENT MEASURES

SCDOT requires that feasible and reasonable noise abatement measures be considered for all predicted build condition traffic noise impacts. Feasibility and reasonableness are distinct and separate considerations. Feasibility is the consideration as to whether noise abatement measures *can* be implemented. Reasonableness is the consideration as to whether noise abatement measures *should* be implemented. Per SCDOT Policy, various traffic noise abatement measures may be considered, including highway alignment selection, traffic systems management measures, noise barriers (noise walls and earthen berms), and noise insulation of NAC D land use facilities.

10.1 Highway Alignment Selection

Highway alignment selection for traffic noise abatement measures involves modifying the horizontal and vertical geometry of the proposed facility to minimize traffic noise to noise-sensitive receptors. The selection of alternative alignments for noise abatement purposes must consider the balance between noise impacts and other engineering and environmental parameters. For noise abatement, horizontal alignment selection is primarily a matter of locating the roadway at a sufficient distance from noise sensitive receptors. Appreciable reductions in traffic noise transmissions to sensitive receptors can be made by adjusting the vertical highway alignment and/or section geometry. For example, lowering a roadway below existing grade creates a cut section which could act similarly as an earth berm, depending upon the relative location(s) of noise-sensitive receptor(s).

10.2 Traffic System Management Measures

Traffic management measures such as prohibition of truck traffic, lowering speed limits, limiting traffic volumes, and/or limiting time of operation were considered as possible traffic noise impact abatement measures. The purpose of the I-26 corridor improvement project is to increase the functional capacity of the highway facility. Prohibition of truck traffic, reduction of the speed limit below the existing speed limits, or screening total traffic volumes would diminish the functional capacity of the highway facility and were not considered practical.

10.3 Noise Barriers

Passive noise abatement measures are effective because they absorb sound energy, extend the source-to-receptor sound transmission path, or both. Sound absorption is a function of abatement medium (e.g., earth berms absorb more sound energy than noise walls of the same height because earth berms are more massive). The source-to-receptor path is extended by placement of an obstacle, such as a wall, that sufficiently blocks the transmission of sound waves that travel from the source to the receptor.

Highway noise barriers are primarily constructed as solid-mass walls or earth berms adjacent to limited-access, or *de facto* access, roadways that are near noise-sensitive land use(s). To be effective, a noise barrier must be long enough and tall enough to shield the impacted receptor(s) from traffic noise. Furthermore, the shielding should be continuous. On roadway facilities with direct driveway access, noise barriers may not be feasible, as gaps required for driveways would reduce the effectiveness of traffic noise attenuation. Due to the requisite lengths for effectiveness, noise barriers are typically not economical for isolated or most low-density areas. However, noise barriers may be economical for the benefit of as few as three predicted traffic noise impacts if the barrier benefits enough total receptors–impacted and non-impacted combined–to meet applicable reasonableness criteria.

SCDOT Policy requires identification whether it is "likely" or "unlikely" that noise barriers will be installed for each NSA identified. "Likely" does not mean a firm commitment. Consideration for noise abatement measures was given to all impacted receptors. Traffic noise impacts are predicted to occur in fifteen (15) NSAs. A total of nine (9) noise barriers were evaluated for the predicted impacts. For each noise abatement measure, feasibility is considered first, then reasonableness. If noise abatement is not feasible, then consideration of reasonableness is not warranted. A receptor is considered benefited if a five dB(A) reduction in traffic noise levels is achieved with a noise barrier. All nine (9) noise abatement measures were found to be feasible but not reasonable for the I-26 corridor improvement project; a detailed discussion can be found in the text below.

NSA 1

Traffic Noise impacts were predicted to occur at two NAC B residential receptors representing two residences within NSA 1. Noise abatement was not evaluated in this area because of not being able to achieve the feasibility requirement of noise reductions of at least 5 dB(A) for at least three impacted receptors. Therefore, noise abatement is not considered likely and was not evaluated for this NSA as part of this analysis.

NSA 2 (Barrier 2)

Design year (2055) Build noise levels were predicted to exceed the NAC at three receptors representing three residential receptors within NSA 2. Barrier 2 was evaluated for these specific impacts within NSA 2. Barrier 2 is located along the southbound side of I-26 beginning south of the I-26 weigh station and just north of Spring Branch Road, spanning approximately 1,344 feet with an average height of 11.8 feet. The location of the barrier is shown in Figures 2-6 and 2-7. Barrier 2 achieves feasible (>5 dB(A)) noise reductions at all three of the impacted receptors (see

Appendix B) representing three residential receptors within NSA 2. The barrier meets the design goal of an insertion loss (IL) of 7 dB(A) for at least one benefited receptor at the evaluated height. The evaluated barrier provides benefits at no additional non-impacted receptors. The total area for the barrier is 15,888 square feet. It is considered not reasonable due to its Maximum Square Footage of Abatement per Benefited Receptor (MaxSF/BR) value of 5,296, which is above the allowable (MaxSF/BR) value of 1,500. Therefore, Barrier 2 is considered feasible but not reasonable. A summary of the abatement for Barrier 2 can be found in Appendix B and C.

NSA 3

Traffic Noise impacts were predicted to occur at one NAC B residential receptor representing one residence within NSA 3. Noise abatement was not evaluated in this area because of not being able to achieve the feasibility requirement of noise reductions of at least 5 dB(A) for at least three impacted receptors. Therefore, noise abatement is not considered likely and was not evaluated for this NSA as part of this analysis.

NSA 4

Traffic Noise impacts were predicted to occur at one NAC B residential receptor representing one residence within NSA 3. Noise abatement was not evaluated in this area because of not being able to achieve the feasibility requirement of noise reductions of at least 5 dB(A) for at least three impacted receptors. Therefore, noise abatement is not considered likely and was not evaluated for this NSA as part of this analysis.

NSA 5

Traffic Noise impacts were predicted to occur at four NAC B residential receptors representing four residences within NSA 5. Although traffic noise impacts are predicted to occur, the distance between receptors 5-01/5-02 and 5-08/5/09 is approximately 1,800 linear feet. Thus designing mitigation for this NSA is not feasible. As such, receptors 5-02/5-02 and 5-08/5/09 are considered isolated from one another. Noise Abatement was not evaluated in this area because of not being able to achieve the feasibility requirement of noise reductions of at least 5 dB(A) for at least three impacted receptors. Therefore, noise abatement is not considered likely and was not evaluated for this NSA as part of this analysis.

NSA 6

Traffic Noise impacts were predicted to occur at one NAC B residential receptor representing one residence within NSA 6. Noise abatement was not evaluated in this area because of not being able to achieve the feasibility requirement of noise reductions of at least 5 dB(A) for at least three impacted receptors. Therefore, noise abatement is not considered likely and was not evaluated for this NSA as part of this analysis.

NSA 9

Traffic Noise impacts were predicted to occur at one NAC B residential receptor representing one residence within NSA 9. Noise abatement was not evaluated in this area because of not being able to achieve the feasibility requirement of noise reductions of at least 5 dB(A) for at least three

impacted receptors. Therefore, noise abatement is not considered likely and was not evaluated for this NSA as part of this analysis.

NSA 11 (Barrier 11)

Design year (2055) Build noise levels were predicted to exceed the NAC at six receptors representing six residential receptors within NSA 11. Barrier 11 was evaluated for these specific impacts within NSA 11. Barrier 11 is located along the southbound side of I-26 beginning south of 2nd Bend Road between I-26 southbound and Honeysuckle Road, spanning approximately 2,040 feet with an average height of 13.8 feet. The location of the barrier is shown in Figure 2-16. Barrier 11 achieves feasible (>5 dB(A)) noise reductions at five of the six impacted receptors (see Appendix B) representing five residential receptors within NSA 11. The barrier meets the design goal of an insertion loss (IL) of 7 dB(A) for at least one benefited receptor at the evaluated height. The evaluated barrier provides benefits at one additional non-impacted receptor representing one residential receptor. The total area for the barrier is 28,081 square feet. It is considered not reasonable due to its Maximum Square Footage of Abatement per Benefited Receptor (MaxSF/BR) value of 4,680, which is above the allowable (MaxSF/BR) value of 1,500. Therefore, Barrier 11 is considered feasible but not reasonable. A summary of the abatement for Barrier 11 can be found in Appendix B and C.

NSA 12 (Barrier 12)

Design year (2055) Build noise levels were predicted to exceed the NAC at four receptors representing four residential receptors within NSA 12. Barrier 12 was evaluated for these specific impacts within NSA 12. Barrier 12 is located along the northbound side of I-26 beginning south of 2nd Bend Road between I-26 northbound and Dantzler Pond Road, spanning approximately 1,032 feet with an average height of 13.8 feet. The location of the barrier is shown in Figures 2-16, and 2-17. Barrier 12 achieves feasible (>5 dB(A)) noise reductions at all four impacted receptors (see Appendix B) representing four residential receptors within NSA 12. The barrier meets the design goal of an insertion loss (IL) of 7 dB(A) for at least one benefited receptor at the evaluated height. The evaluated barrier provides benefits at no additional non-impacted receptors. The total area for the barrier is 14,208 square feet. It is considered not reasonable due to its Maximum Square Footage of Abatement per Benefited Receptor (MaxSF/BR) value of 3,552, which is above the allowable (MaxSF/BR) value of 1,500. Therefore, Barrier 12 is considered feasible but not reasonable. A summary of the abatement for Barrier 12 can be found in Appendix B and C.

NSA 14 (Barrier 14)

Design year (2055) Build noise levels were predicted to exceed the NAC at fifteen receptors representing fifteen residential receptors within NSA 14. Barrier 14 was evaluated for thirteen of these impacts within NSA 14 that are located along Two Churches Road west of Hunting Club Road, Sites 14-14 and 14-15 are isolated from the remaining impacted sites within NSA 14 and were not included in the mitigation analysis and furthermore, did not require a separate mitigation analysis since these isolated receptors do not meet the requirements of the noise policy. Barrier 14 is located along the northbound side of I-26 beginning north of County Road S-18-139 between I-26 northbound and 2 Churches Road, spanning approximately 3,140 feet with an average height of 13.9 feet. The location of the barrier is shown in Figures 2-19. Barrier 14 achieves feasible (>5 dB(A)) noise reductions at all thirteen impacted receptors (see Appendix B) representing thirteen

residential receptors within NSA 14. The barrier meets the design goal of an insertion loss (IL) of 7 dB(A) for at least one benefited receptor at the evaluated height. The evaluated barrier provides benefits at no additional non-impacted receptors. The total area for the barrier is 43,481 square feet. It is considered not reasonable due to its Maximum Square Footage of Abatement per Benefited Receptor (MaxSF/BR) value of 3,345, which is above the allowable (MaxSF/BR) value of 1,500. Therefore, Barrier 14 is considered feasible but not reasonable. A summary of the abatement for Barrier 14 can be found in Appendix B and C.

NSA 16 (Barrier 16A)

Design year (2055) Build noise levels were predicted to exceed the NAC at six receptors representing six residential receptors within NSA 16. NSA 16 encompasses territory both north and south of County Road S-18-139. Barrier 16A was evaluated for the impacts specifically related to the area north of County Road S-18-139 within NSA 16. Barrier 16A is located along the southbound side of I-26 beginning north of County Road S-18-139 between I-26 southbound and Honeysuckle Road, spanning approximately 1,536 feet with an average height of 14.4 feet. The location of the barrier is shown in Figures 2-21. Barrier 16A achieves feasible (>5 dB(A)) noise reductions at all three impacted receptors (see Appendix B) representing three residential receptors within this portion of NSA 16. The barrier meets the design goal of an insertion loss (IL) of 7 dB(A) for at least one benefited receptor at the evaluated height. The evaluated barrier provides benefits at no additional non-impacted receptors. The total area for the barrier is 22,177 square feet. It is considered not reasonable due to its Maximum Square Footage of Abatement per Benefited Receptor (MaxSF/BR) value of 7,392, which is above the allowable (MaxSF/BR) value of 1,500. Therefore, Barrier 16A is considered feasible but not reasonable. A summary of the abatement for Barrier 16A can be found in Appendix B and C.

NSA 16 (Barrier 16B)

Design year (2055) Build noise levels were predicted to exceed the NAC at six receptors representing six residential receptors within NSA 16. NSA 16 encompasses territory both north and south of County Road S-18-139. Barrier 16B was evaluated for the impacts specifically related to the area south of County Road S-18-139 within NSA 16. Barrier 16B is located along the southbound side of I-26 beginning south of County Road S-18-139 between I-26 southbound and Harrison Road, spanning approximately 1,464 feet with an average height of 15.8 feet. The location of the barrier is shown in Figures 2-21. Barrier 16B achieves feasible (>5 dB(A)) noise reductions at all three impacted receptors (see Appendix B) representing three residential receptors within this portion of NSA 16. The barrier meets the design goal of an insertion loss (IL) of 7 dB(A) for at least one benefited receptor at the evaluated height. The evaluated barrier provides benefits at no additional non-impacted receptors. The total area for the barrier is 23,136 square feet. It is considered not reasonable due to its Maximum Square Footage of Abatement per Benefited Receptor (MaxSF/BR) value of 7,712, which is above the allowable (MaxSF/BR) value of 1,500. Therefore, Barrier 16B is considered feasible but not reasonable. A summary of the abatement for Barrier 16B can be found in Appendix B and C.

NSA 18 (Barrier 18)

Design year (2055) Build noise levels were predicted to exceed the NAC at thirteen receptors representing thirteen residential receptors within NSA 18. Barrier 18 was evaluated for these specific impacts within NSA 18. Barrier 18 is located along the northbound side of I-26 beginning

south of County Road S-18-139 between I-26 northbound and Sweatman Road, spanning approximately 4,776 feet with an average height of 16 feet. The location of the barrier is shown in Figures 2-21 and 2-23. Barrier 18 achieves feasible (>5 dB(A)) noise reductions at all thirteen impacted receptors (see Appendix B) representing thirteen residential receptors within NSA 18. The barrier meets the design goal of an insertion loss (IL) of 7 dB(A) for at least one benefited receptor at the evaluated height. The evaluated barrier provides benefits at one additional non-impacted receptor representing one residential receptor. The total area for the barrier is 76,271 square feet. It is considered not reasonable due to its Maximum Square Footage of Abatement per Benefited Receptor (MaxSF/BR) value of 5,448, which is above the allowable (MaxSF/BR) value of 1,500. Therefore, Barrier 18 is considered feasible and not reasonable. A summary of the abatement for Barrier 18 can be found in Appendix B and C.

NSA 19 (Barrier 19)

Design year (2055) Build noise levels were predicted to exceed the NAC at six receptors representing six residential receptors within NSA 19. Barrier 19 was evaluated for these specific impacts within NSA 19. Barrier 19 is located along the southbound side of I-26 beginning south of County Road S-18-139 between I-26 southbound and Harrison Road, near Family Circle. Barrier 19 spans approximately 1,152 feet with an average height of 16 feet. The location of the barrier is shown in Figures 2-23. Barrier 19 achieves feasible (>5 dB(A)) noise reductions at all six impacted receptors (see Appendix B) representing six residential receptors within NSA 19. The barrier meets the design goal of an insertion loss (IL) of 7 dB(A) for at least one benefited receptor at the evaluated height. The evaluated barrier provides benefits at no additional non-impacted receptors. The total area for the barrier is 18,385 square feet. It is considered not reasonable due to its Maximum Square Footage of Abatement per Benefited Receptor (MaxSF/BR) value of 3,064, which is above the allowable (MaxSF/BR) value of 1,500. Therefore, Barrier 19 is considered feasible but not reasonable. A summary of the abatement for Barrier 19 can be found in Appendix B and C.

NSA 20 (Barrier 20)

Design year (2055) Build noise levels were predicted to exceed the NAC at three receptors representing three residential receptors within NSA 20. Barrier 20 was evaluated for these specific impacts within NSA 20. Barrier 20 is located along the northbound side of I-26 beginning north of Beidler Forest Road between I-26 northbound and County Road S-18-830. Barrier 20 spans approximately 2,210 feet with an average height of 18 feet. The location of the barrier is shown in Figures 2-25 and 2-26. Barrier 20 achieves feasible (>5 dB(A)) noise reductions at all three impacted receptors (see Appendix B) representing three residential receptors within NSA 20. The barrier meets the design goal of an insertion loss (IL) of 7 dB(A) for at least one benefited receptor at the evaluated height. The evaluated barrier provides benefits at no additional non-impacted receptors. The total area for the barrier is 39,783 square feet. It is considered not reasonable due to its Maximum Square Footage of Abatement per Benefited Receptor (MaxSF/BR) value of 13,261, which is above the allowable (MaxSF/BR) value of 1,500. Therefore, Barrier 20 is considered feasible but not reasonable. A summary of the abatement for Barrier 20 can be found in Appendix B and C.

NSA 21

Traffic Noise impacts were predicted to occur at one NAC B residential receptors representing one residence within NSA 21. Noise abatement was not evaluated in this area because of not being able to achieve the feasibility requirement of noise reductions of at least 5 dB(A) for at least three impacted receptors. Therefore, noise abatement is not considered likely and was not evaluated for this NSA as part of this analysis.

No noise abatement measures are presently considered likely for incorporation into the I-26 corridor improvement project design plans.

10.4 Noise Insulation

Traffic noise was not predicted to impact any NAC D land uses in the vicinity of the I-26 corridor improvement project as no NAC D land uses are located within the project corridor; therefore, noise insulation would not be an appropriate noise abatement measure for this project. Typical standardized building noise reduction factors used when NAC D receptors are present in a study area are shown below in Table 5.

Table 5: Building Noise Reduction Factors

Building Type	Window Condition	Noise Reduction Due to Exterior of the Structure
All	Open[1]	10 dB(A)
Light Frame	Ordinary Sash (closed)	20 dB(A)
	Storm Windows	25 dB(A)
Masonry	Single Glazed	25 dB(A)
	Double Glazed	35 dB(A)

1 The windows shall be considered open unless there is firm knowledge that the windows are in fact kept closed almost every day of the year.

FHWA-HEP-18-065, Noise Measurement Handbook, Final Report, June 2018 provides procedures to measure building noise reductions.

11.0 CONSTRUCTION NOISE

The predominant construction activities associated with this project are expected to be grading, milling, paving and striping. Temporary and localized construction noise impacts may occur as a result of these activities. For information on typical noise level emissions of common construction equipment, refer to Table 6.

Table 6: Construction Equipment Typical Noise Level Emissions[1]

Equipment	Noise Level Emissions (dB(A)) at 50 Feet from Equipment[2]
	70 80 90 100
Pile Driver[3]	
Jack Hammer	
Tractor	
Road Grader	
Backhoe	
Truck	
Paver	
Pneumatic Wrench	
Crane	
Concrete Mixer	
Compressor	
Front-End Loader	
Generator	
Saws	
Roller (Compactor)	

1. Adapted from *Noise Construction Equipment and Operations, Building Equipment, and Home Appliances*. US Environmental Protection Agency. Washington DC 1971.
2. Cited noise level ranges are typical for the equipment cited. Noise energy dissipates as a function of distance between the source and the receptor. For example, if the noise level from a pile driver at a distance of 50 feet = 100 decibels (dB(A)), then at 400 feet, it might be 82 decibels (dB(A)) or less.
3. Due to project safety and potential construction noise concerns, pile driving activities are typically limited to daytime hours.

During daytime hours, the potential effects of construction noise could be temporary speech interference for passersby and those individuals living or working near the project. During evening and nighttime hours, steady-state construction noise emissions, such as those from paving operations, could be audible and may cause impacts to activities such as sleep. Sporadic evening and nighttime construction equipment noise emissions, such as from backup alarms, lift gate closures ("slamming" of dump truck gates), etc., will be perceived as distinctly louder than the steady-state acoustic environment, and could affect the general peace and usage of noise-

sensitive areas. Extremely loud construction noise activities such as usage of pile-drivers and impact-hammers (jack hammer, hoe-ram) may cause temporary, sporadic, and acute construction noise impacts in isolated areas.

Construction activities that will produce extremely loud noises should be scheduled during times of the day when such noises will create as minimal disturbance as possible, specifically weekday daytime hours since the primary land uses expected to be temporarily affected by construction noise for the project are residential land uses being located throughout the project corridor, particular consideration should be given to avoiding times of regularly occurring services or activities in the vicinity of these locations.

Generally, low-cost and easily implemented construction noise control measures should be incorporated into the project plans and specifications to the extent possible. These measures include, but are not limited to, work-hour limits, equipment exhaust muffler requirements, haul-road locations, elimination of "tail gate banging," ambient-sensitive backup alarms, construction noise complaint mechanisms, and consistent and transparent community communication.

While discrete construction noise level prediction is difficult for a particular receptor or group of receptors, it can be assessed in a general capacity with respect to distance from known or likely project activities. For this project earth removal, grading, hauling, paving and striping are anticipated to occur in the vicinity of noise-sensitive receptors throughout the entire project. Although construction noise abatement should not place an undue burden on the financial cost of the project or the project construction schedule, pursuant to the requirements of Title 23 CFR 772.19, it is the recommendation of this DNA that:

- Earth removal, grading, hauling and paving activities in the vicinity of residences should be limited to weekday daytime hours when practicable.

- If meeting the project schedule requires that earth removal, grading, hauling and / or paving must occur during evening, nighttime and / or weekend hours in the vicinity of residential neighborhoods, the Contractor shall notify SCDOT as soon as possible. In such instance(s), all reasonable attempts shall be made to notify and to make appropriate arrangements for the abatement of the predicted construction noise upon the affected property owners and / or residents.

- If construction noise activities must occur during context-sensitive hours in the vicinity of noise-sensitive areas, discrete construction noise abatement measures including, but not limited to, portable noise barriers and / or other equipment-quieting devices should be considered.

- Some construction activities could create extreme noise for nearby noise-sensitive land uses. It is the recommendation of this DNA that considerations be made for any nearby residences for all evening and/or nighttime periods (7:00 p.m. – 7:00 a.m.) throughout which extremely loud construction activities might occur.

For additional information on construction noise, please refer to the *FHWA Construction Noise Handbook* (FHWA-HEP-06-015) and the *Roadway Construction Noise Model* (RCNM), available online at:
https://www.fhwa.dot.gov/environment/noise/construction_noise/handbook/

12.0 COORDINATION WITH LOCAL OFFICIALS

Predicted Build condition traffic noise level contours are not a definitive means by which to assess traffic noise impacts; however, they can aid in future land use planning efforts in presently undeveloped areas. Typically, the distances from the proposed edge of the nearest travel lane at which the 71 dB(A) and 66 dB(A) noise level contours are predicted to occur are provided in tabular format. The 71 dB(A) represents the traffic noise impact threshold for FHWA NAC E land uses, while 66 dB(A) does the same for NAC B and C land uses. Table 7 below details the distances at which each threshold is predicted to be met based on the current undeveloped lands within the project corridor. It should be noted that contact with Dorchester County was conducted on August 19th, 2025, to confirm the status of any active planned or issued building permit. A majority of the project corridor is within Dorchester County limits with a small portion falling within Berkeley County bounds. It should be noted that the section of the proposed project within Berkeley County is being evaluated as part of another project and therefore coordination with this locality was not necessary for this area of the project corridor. Coordination with Dorchester County along with desktop reconnaissance using the Dorchester County GIS permit portal confirmed that no additional noise sensitive land use receptors are permitted/planned, requiring no additional noise sensitive land use modeling at this time.

Table 7: Traffic Noise Contours [1]

Location[2]	Approximate Distance from Roadway Edge of Travel (feet)	
	NAC B & C 66 dB(A)[3]	NAC E 71 dB(A)[3]

1. The contour distances correlating to 66 dB(A) and 71 dB(A) NAC criteria are presented for consideration of land use control in undeveloped areas in which future development of NAC B, C, and/or E noise-sensitive land use receptors may occur.

2. Noise contour segments represent specific undeveloped areas within the proximity identified in the location description.
3. Noise contour distances to 66 dB(A) and 71 dB(A) are the distances between the edge of the nearest proposed travel lane and modeled receptors for which predicted traffic noise levels were 66 dB(A) and 71 dB(A), respectively, in Design Year (2055) Build condition TNM models for the indicated NSAs. The distances should not be assumed to infer exact traffic noise levels for specific locations adjacent to the proposed project. The distances to the 71 dB(A) and 66 dB(A) contours, as well as the distances between the 71 dB(A) and 66 dB(A) contours, vary according to the specific acoustically relevant features of each NSA.

13.0 NOISE-COMPATIBLE LAND USE

SCDOT strongly advocates the planning, design, and construction of noise-compatible development and encourages its practice among planners, building officials, developers, and others. Consideration for noise-compatible development is a shared responsibility among local, state, and federal agencies. SCDOT plans its highway construction in consideration of traffic noise impacts it may cause to noise-sensitive land uses. Likewise, local governments ideally plan their noise-sensitive land uses in consideration of existing sources of traffic noise.

Although regulation of land use is not within the purview of FHWA or SCDOT, some widely accepted techniques for noise-sensitive land use planning near existing and proposed highway facilities include:

- Locating retail, industrial, manufacturing, and other noise-compatible land-uses adjacent to highways

- Incorporating effective traffic noise mitigating features, such as earth berms and solid-mass noise walls, as part of residential developments

- Utilization of noise-sensitive architectural design and site planning, such as the orientation of quiet spaces away from roadways

- Required use of sound insulating building materials and construction methods

SCDOT will provide information to assist local jurisdictions in the development of local noise controls, when requested. SCDOT strongly advocates the planning, design and construction of noise-compatible development and encourages its practice among planners, building officials, developers and others.

14.0 CONCLUSION

Traffic noise and temporary construction noise can be a consequence of transportation projects, especially in areas near high-volume and high-speed existing steady-state traffic noise sources. This DNA utilized computer models created with the FHWA TNM 2.5, validated to field-collected

traffic noise measurement data, to predict future noise levels and define impacted receptors within the proposed I-26 corridor.

Design Year (2055) Build traffic volumes are predicted to create sixty-seven (67) traffic noise impacts. Furthermore, construction noise impacts–some of them potentially substantial–may occur due to the proximity of numerous noise-sensitive receptors to project construction activities. It is the recommendation of this DNA that all reasonable efforts should be made to minimize exposure of noise-sensitive areas to construction noise impacts.

In accordance with the 2023 SCDOT Policy, consideration for noise abatement measures was given to all predicted impacted receptors in the vicinity of the I-26 corridor improvements. No noise abatement measures were found to be preliminarily reasonable; therefore, no noise abatement measures are presently considered likely for incorporation into the I-26 project design plans.

Unless modifications to the project preliminary design occur, such as consideration of additional build alternative(s) and/or changes to predicted Design Year (2055) Build traffic volumes, no traffic noise abatement measures are recommended for detailed analysis during final design, and no noise abatement measures are proposed for incorporation into the I-26 corridor improvement project. This analysis completes the traffic noise requirements of the Title 23 CFR Part 772 and SCDOT Policy.

The I-26/SR 27 interchange was recently reconstructed as part of an independent project. Roadway design files and traffic data for this interchange were not made available. As no roadway modifications are proposed at this location under the I-26 Widening Phase 1 Project, the previously identified noise-sensitive areas were excluded from further analysis. While preliminary field investigations identified potential noise-sensitive receptors (NSAs 22 & 23) within the study limits, these receptors & NSAs were subsequently excluded from detailed evaluation based on the factors described above.

APPENDIX B
INSERTION LOSS TABLES

Barrier 2

I-26 Corridor Improvement Project

Optimized Barrier Results

1	2	3	4			5	6	7
NSA Descriptor	Barrier	Receptor Site	Site Representation			Build (2055) Unabated Noise Level	Build (2055) Abated Noise Level	Net Insertion Loss
			DU	Land Use	NAC			
NSA 2	Barrier 2	02-01	1	Residential	B	77	68	9
		02-02	1	Residential	B	74	66	7
		02-03	1	Residential	B	69	65	5

Noise Levels approach or exceed FHWA/SCDOT Noise Abatement Criteria

Insertion Losses are considered "feasible" (5 dB(A))

Insertion Losses are 7 dB(A) or greater

Insertion Losses are developed by subtracting sound levels reported out to the tenth of a decimal. Due to rounding, the value shown in Column 7 may vary from the difference between the displayed abated and un-abated levels.

APPENDIX C

WARRANTED, FEASIBLE, & REASONABLE WORKSHEETS

SCDOT Feasibility and Reasonableness Worksheet

Date: 8/20/2025

Project Name	I-26 Corridor Improvements Project
Highway Traffic Noise Abatement Measure	Barrier 2

Feasibility

Number of Impacted Receivers	3	Number of Benefited Receivers	3
Number of Impacted Receivers that would achieve a 5 dBA reduction from the proposed noise abatement measure	3		

Is the proposed noise abatement measure acoustically feasible?
NOTE: SCDOT Policy indicates that 3 impacted receptors must achieve at least a 5 dBA reduction for it to be acoustically feasible.

☒ Yes ☐ No

Would any of the following issues limit the ability of the abatement measure to achieve the noise reduction goal?

Topography	☐ Yes	☒ No
Safety	☐ Yes	☒ No
Drainage	☐ Yes	☒ No
Utilities	☐ Yes	☒ No
Maintenance	☐ Yes	☒ No
Access	☐ Yes	☒ No
Exposed Height of Wall	☐ Yes	☒ No

If "Yes" was marked for any of the questions above, please explain below.

Detailed Description

Reasonableness

According to 23 CFR 772.13(d)(2)(iv) the abatement measure must collectively achieve each of these criteria to be reasonable. Therefore if any of the three mandatory reasonable factors are not achieved, then the abatement measure is determined NOT to be reasonable. When completing the form it is not necessary to detail each of the criteria if one was determined not to be reasonable.

#1: Noise Reduction Design Goal

Number of Benefited Receivers	3	Number of Benefited Receivers that achieve at least an 7 dBA reduction	2

Number of benefited receptors that would achieve at least a 7 dBA reduction from the proposed noise abatement measure. NOTE: SCDOT noise policy states that at least one (1) benefited receptor must achieve a 7dBA reduction from the noise abatement measure. 2

Does the proposed noise abatement measure meet the noise reduction design goal? [x] Yes [ ] No

If "Yes" is marked, continue to #2. If "No" is marked, then abatement is determined NOT to be reasonable.

#2: Cost Effectiveness

Estimated area of noise abatement measure.	15,888	Number of Benefited Receivers	3
Estimated area per Benefited Receiver	5,296		

Based on the SCDOT policy of 1,500 sq. ft. per Benefited Receiver, would the abatement measure be reasonable? [ ] Yes [x] No

If "Yes" is marked, continue to #3. If "No" is marked, then abatement is determined NOT to be reasonable.

#3: Viewpoints of the property owners and residents of the benefitted receivers

Number of Benefited Receivers (same as above)			
Number of Benefited Receivers in **support** of noise abatement measure		Percentage of Benefited Receivers in **support** of noise abatement measure	
Number of Benefited Receivers **opposed** to noise abatement measure		Percentage of Benefited Receivers **opposed** to noise abatement measure	
Number of Benefited Receivers **that did not respond** to solicitation on noise abatement measure		Percentage of Benefited Receivers **that did not respond** to solicitation on noise abatement measure	

Based on the viewpoints of the property owners and residents of the Benefited Receivers, would the abatement measure be reasonable? NOTE: SCDOT Policy indicates that the noise abatement shall be constructed unless greater than 50% of the benefited receptors are opposed to noise abatement. [ ] Yes [ ] No

Final Determination for Noise Abatement Measure

If "Yes" is marked, continue to #2. If "No" is marked, then abatement is determined NOT to be reasonable.

#2: Cost Effectiveness

Estimated area of noise abatement measure.	76,271	Number of Benefited Receivers	14
Estimated area per Benefited Receiver	5,448		

Based on the SCDOT policy of 1,500 sq. ft. per Benefited Receiver, would the abatement measure be reasonable? [ ] Yes [x] No

If "Yes" is marked, continue to #3. If "No" is marked, then abatement is determined NOT to be reasonable.

#3: Viewpoints of the property owners and residents of the benefitted receivers

Number of Benefited Receivers (same as above)			
Number of Benefited Receivers in **support** of noise abatement measure		Percentage of Benefited Receivers in **support** of noise abatement measure	
Number of Benefited Receivers **opposed** to noise abatement measure		Percentage of Benefited Receivers **opposed** to noise abatement measure	
Number of Benefited Receivers **that did not respond** to solicitation on noise abatement measure		Percentage of Benefited Receivers **that did not respond** to solicitation on noise abatement measure	

Based on the viewpoints of the property owners and residents of the Benefited Receivers, would the abatement measure be reasonable? NOTE: SCDOT Policy indicates that the noise abatement shall be constructed unless greater than 50% of the benefited receptors are opposed to noise abatement. [ ] Yes [ ] No

Final Determination for Noise Abatement Measure

SCDOT Feasibility and Reasonableness Worksheet

Date: 8/20/2025

Project Name	I-26 Corridor Improvements Project
Highway Traffic Noise Abatement Measure	Barrier 19

Feasibility

Number of Impacted Receivers	6
Number of Benefited Receivers	6
Number of Impacted Receivers that would achieve a 5 dBA reduction from the proposed noise abatement measure	6

Is the proposed noise abatement measure acoustically feasible?
NOTE: SCDOT Policy indicates that 3 impacted receptors must achieve at least a 5 dBA reduction for it to be acoustically feasible.

☒ Yes ☐ No

Would any of the following issues limit the ability of the abatement measure to achieve the noise reduction goal?

Topography	☐ Yes	☒ No
Safety	☐ Yes	☒ No
Drainage	☐ Yes	☒ No
Utilities	☐ Yes	☒ No
Maintenance	☐ Yes	☒ No
Access	☐ Yes	☒ No
Exposed Height of Wall	☐ Yes	☒ No

If "Yes" was marked for any of the questions above, please explain below.

Detailed Description

Reasonableness

According to 23 CFR 772.13(d)(2)(iv) the abatement measure must collectively achieve each of these criteria to be reasonable. Therefore if any of the three mandatory reasonable factors are not achieved, then the abatement measure is determined NOT to be reasonable. When completing the form it is not necessary to detail each of the criteria if one was determined not to be reasonable.

#1: Noise Reduction Design Goal

Number of Benefited Receivers	6	Number of Benefited Receivers that achieve at least an 7 dBA reduction	3

Number of benefited receptors that would achieve at least a 7 dBA reduction from the proposed noise abatement measure. NOTE: SCDOT noise policy states that at least one (1) benefited receptor must achieve a 7dBA reduction from the noise abatement measure. 3

Does the proposed noise abatement measure meet the noise reduction design goal? [x] Yes [ ] No

If "Yes" is marked, continue to #2. If "No" is marked, then abatement is determined NOT to be reasonable.

#2: Cost Effectiveness

Estimated area of noise abatement measure.	18,385	Number of Benefited Receivers	6
Estimated area per Benefited Receiver	3,064		

Based on the SCDOT policy of 1,500 sq. ft. per Benefited Receiver, would the abatement measure be reasonable? [ ] Yes [x] No

If "Yes" is marked, continue to #3. If "No" is marked, then abatement is determined NOT to be reasonable.

#3: Viewpoints of the property owners and residents of the benefitted receivers

Number of Benefited Receivers (same as above)			
Number of Benefited Receivers in **support** of noise abatement measure		Percentage of Benefited Receivers in **support** of noise abatement measure	
Number of Benefited Receivers **opposed** to noise abatement measure		Percentage of Benefited Receivers **opposed** to noise abatement measure	
Number of Benefited Receivers **that did not respond** to solicitation on noise abatement measure		Percentage of Benefited Receivers **that did not respond** to solicitation on noise abatement measure	

Based on the viewpoints of the property owners and residents of the Benefited Receivers, would the abatement measure be reasonable? NOTE: SCDOT Policy indicates that the noise abatement shall be constructed unless greater than 50% of the benefited receptors are opposed to noise abatement. [ ] Yes [ ] No

APPENDIX F

NOISE METER AND ACOUSTICAL CALIBRATOR
CALIBRATION CERTIFICATES

Scantek, Inc.
CALIBRATION LABORATORY

ISO 17025: 2017, ANSI/NCSL Z540:1994 Part 1
ACCREDITED by NVLAP (an ILAC MRA signatory)

NVLAP®
CALIBRATION
NVLAP Lab Code: 200625-0

Calibration Certificate No.49969

Instrument: **Sound Level Meter**
Model: **NL42**
Manufacturer: **Rion**
Serial number: **00296558**
Tested with: **Microphone UC52 s/n 179162**
Preamplifier NH24 s/n 87568
Type (class): **2**
Customer: **ATCS**
Tel/Fax: **717-636-1027**

Date Calibrated: **7/6/2023** *Cal Due:*

Status:	Received	Sent
In tolerance:	X	X
Out of tolerance:		
See comments:		

Contains non-accredited tests: __Yes _X_ No
Calibration service: __ Basic _X_ Standard
Address: **4999 Louise Drive, Suite 106**
Mechanicsburg, PA 17055

Tested in accordance with the following procedures and standards:
Calibration of Sound Level Meters, Scantek Inc., Rev. 6/26/2015
SLM & Dosimeters – Acoustical Tests, Scantek Inc., Rev. 7/6/2011

Instrumentation used for calibration: Nor-1504 Norsonic Test System:

Instrument - Manufacturer	Description	S/N	Cal. Date	Traceability evidence Cal. Lab / Accreditation	Cal. Due
483B-Norsonic	SME Cal Unit	31052	Nov 7, 2022	Scantek, Inc./ NVLAP	Nov 7, 2023
DS-360-SRS	Function Generator	88077	Dec 21, 2022	ACR Env./ A2LA	Dec 21, 2024

APPENDIX I
LIST OF PREPARERS AND REVIEWERS

List of Preparers/ Reviewers

ATCS, Inc.

Josh J. Wilson
SVP, North Region Manager
Education: B.S., Geo-Environmental Studies
M.S., Geo-Environmental Studies
Professional Experience: 24 Years
Role: QA/QC

Jack Cramer
VP, PA Operations Manager
Education: B.S., Geo-Environmental Studies
Professional Experience: 25 Years
Role: QA/QC

Jaret Demcher, ENVSP
Noise Discipline Senior Manager
Education: B.A., Geography, Environmental Planning
Professional Experience: 13 Years
Role: Project Coordination, Project Oversight, QA/QC

Ethan Anderson
Lead Noise Analyst
Education: B.S., Geo-Environmental Studies
Professional Experience: 9 years
Role: Data Collection, Noise Modeling

Jacob Percey
Noise Discipline Analyst
Education: B.S., Geo-Environmental Studies
M.S., Geo-Environmental Studies
Professional Experience: 6 years
Role: Project Coordination, Data Collection, Noise Modeling, Report Preparation, Mitigation Evaluation

Elizabeth Stigelman
Noise Discipline Analyst
Education: B.A, Geospatial Applications
Professional Experience: < 1 year
Role: Noise Modeling, Report Preparation, and Figure Creation
